C. Sheppard, Simon K. Davy, Graham M. Pilling, 2009-06-25 Coral reefs represent the most spectacular and diverse marine ecosystem on the planet as well as a critical source of income

for millions of people. However, the combined effects of human activity have led to a rapid decline in the health of reefs worldwide, with many now facing complete destruction. This timely book provides an integrated overview of the function, physiology, ecology, and behaviour of coral reef organisms. Each chapter is enriched with a selection of boxes on specific aspects, written by internationally recognised experts. As with other books in the Biology of Habitats Series, the emphasis in this book is on the organisms that dominate this marine environment, although pollution, conservation, climate change, and experimental aspects are also included. Indeed, particular emphasis is placed on conservation and management due to the habitat's critically endangered status. A global range of examples is employed, which gives the book international relevance. This accessible text is intended for students, naturalists, and professionals and assumes no previous knowledge of coral reef biology. It is particularly suitable for both senior undergraduate and graduate students in departments of biology, geography, and environmental science, taking courses in coral reef ecology, marine biology, oceanography, and conservation biology, as well as the many professional ecologists and conservation biologists requiring a concise overview of the topic. It will also be of relevance and use to reef managers, recreational divers, and amateur naturalists.

Aquatic Ecosystems Nicholas V. C. Polunin, 2008-09-11

Concern about future supplies of fresh water to society to meet the full range of human needs now comes very high on the priority list of global societal issues. An overarching issue which this book addresses is whether global climate change is a dominant driver of change in the structure and function of all natural water-based ecosystems, or whether direct human population growth and accelerated consumption are playing an equal or greater role. This book divides the whole aquatic realm into 21 ecosystems, from those on land, both saline and fresh water, to those of the open and deep oceans. It draws on the understanding of leading ecologists to summarize the state and likely condition by the year 2025 of each of the ecosystems. Written for academic researchers and environmental professionals, the aim is to put the climate change debate into a broader context as a basis for conservation science and planning.
