**Environmental and Health Risk Assessment and Management** Paolo Ricci, 2006-01-27 This textbook is about the law economics practical assessment and the management of risky activities arising from routine catastrophic environmental and occupational exposures to hazardous agents The textbook begins where emission and exposure analysis end by providing estimates or predictions of deleterious exposures Thus we deal with determining the nature and form of relations between exposure and response damage functions and with the principles and methods used to determine the costs and benefits of risk management actions

from the vantage point of single and multiple decision makers Today national and international laws conventions and protocols are increasingly concerned with reducing environmental and health risks through minimizing exposure to toxic substances bacteria viruses and other noxious agents They do so through risk methods The reason for the now worldwide use of risk assessment and management is that individuals and society must decide when and at what cost past and future hazardous conditions can either be avoided or minimized In this process society must account for the limited resources it can spend to remain sustainable Risk based methods play a pivotal role in identifying and ranking alternative sustainable choices while accounting for uncertainty and variability Specifically most reductions in risks require a balancing of the costs and benefits associated with the action to reduce exposure to a hazard and thus risk This balancing necessarily involves linking exposure and response through causation This essential aspect of risk assessment and management if done incorrectly can be costly to society
