Polymer Permeability:

Polymer Permeability J. Comyn, 1985-02-28 Polymers are permeable whilst ceramics glasses and metals are generally impermeable This may seem a disadvantage in that polymeric containers may allow loss or contamination of their contents and aggressive substances such as water will diffuse into polymeric structures such as adhesive joints or fibre reinforced composites and cause weakening However in some cases permeability is an advantage and one particular area where this is so is in the use of polymers in drug delivery systems Also without permeable polymers we would not enjoy the wide range of dyed fabrics used in clothing and furnishing The fundamental reason for the permeability of polymers is their relatively high level of molecular motion a factor which also leads to their high levels of creep in comparison with ceramics glasses and metals The aim of this volume is to examine some timely applied aspects of polymer permeability In the first chapter basic issues in the mathematics of diffusion are introduced and this is followed by two chapters where the fundamental aspects of diffusion in polymers are presented The following chapters then each examine some area of applied science where permeability is a key issue Each chapter is reasonably self contained and intended to be informative without frequent outside reference This inevitably leads to some repetition but it is hoped that this is not excessive

Handbook of Membrane Separations Anil K. Pabby, Syed S.H. Rizvi, Ana Maria Sastre Requena, 2008-07-07 The Handbook of Membrane Separations: Chemical, Pharmaceutical and Biotechnological Applications provides detailed information on membrane separation technologies as they have evolved over the past decades. To provide a basic understanding of membrane technology, this book documents the developments dealing with these technologies. It explores chemical, pharmaceutical, food processing and biotechnological applications of membrane processes ranging from selective separation to solvent and material recovery. This text also presents in depth knowledge of membrane separation mechanisms, transport models, membrane permeability, computations, membrane types and modules as well as membrane reactors.

Gas Transport in Glassy Polymers Maria Grazia De Angelis, Giulio C. Sarti, 2021-04-22 This Special Issue of Membranes focuses on several new aspects of fluid transport in glassy polymers with application in relevant membrane separations such as gas purification, VOC removal and CO₂ capture. In particular, the focus lies on novel experimental techniques and detailed characterization of specific phenomena like polar and multicomponent interactions during transport. The properties of novel materials such as mixed matrix membranes based on glassy polymers and different selective fillers are also presented. A critical review of existing modeling approaches to describe the sorption and transport in glassy polymers suitable for membrane separations is provided, including both macroscopic and atomistic models and relying both on the standard solution diffusion process and on the facilitated transport mechanism.

Nano-Enhanced and

Nanostructured Polymer-Based Membranes for Energy Applications Maria Giovanna Buonomenna,2022-01-22 There is a growing need for better membranes in several emerging application fields especially those related to energy conversion and storage as well as to water treatment and recycling Processability is an important functional property often ignored especially in the early discovery phase for new materials but it should be one of the most important properties that needs to be considered in the development of better membrane materials Useful membrane materials have to be capable of being formed into thin membranes in particular for membrane gas separation water treatment and desalination and then packaged into large area membrane modules All gas separation membranes that are in current commercial use are based on polymers which are solution processable This book intends to deal with composite in most cases hybrid polymer based membranes for

three separate application fields energy conversion energy storage and water treatment and recovery Each chapter will explain clearly the various membrane processes then go on to discuss in detail the corresponding advanced membranes used The logic that lies behind this is that you have to understand the process in order to develop new high performance membranes By taking this approach the author aims to overcome the disconnection that currently exists between membrane materials scientists and industrial process engineers Discusses interdisciplinary content by a single author approaching synthesis and development of materials from the perspective of their processability Describes the novel aspects of membrane science that is related to energy storage conversion and wastewater treatment Presents an emphasis on scientific results which have an impact on real applications in terms of renewable and clean energy challenges
