Lapasin, 2012-12-06 Industrial uses of polysaccharides centre on their ability to thicken or structure many times their own weight of water or in other words to control the rheology of hydrated systems Until comparatively recently however objective characterisation of polysaccharide rheology except in a few specialist research laboratories was largely confined to compression of gels simple measurements of solution viscosity often in ill defined geometries and imitative tests intended to reflect product performance in specific areas of end use Several factors have combined to bring a wider range of rheological techniques into common use One is the increasing practical importance of systems that cannot adequately be described as solids or liquids such as weak gels and spreadable pastes In parallel routine characterisation of such systems has become economically feasible with the development of a new generation of comparatively inexpensive computer controlled instruments There has also been a change of emphasis from phenomenological description of product texture towards the use of rheological measurements to probe the underlying molecular and supramolecular structures and the processes by which they are formed As a result even the most pragmatic producers and users of industrial polysaccharides are probably now familiar with terms such as creep compliance stress overshoot and the ubiquitous G' and G'' although perhaps not fully understanding their precise meaning or practical significance A definitive text giving a rigorous description of the rheological approaches relevant to polysaccharide systems is therefore appropriate and timely Romano Lapasin and Sabrina Priel are to be congratulated for tackling the daunting but worthwhile task of producing such a volume Polysaccharide Based Graft Copolymers Susheel Kalia, M.W. Sabaa, 2013-05-23 Renowned experts give all essential aspects of the techniques and applications of graft copolymers based on polysaccharides Polysaccharides are the most abundant natural organic materials and polysaccharide based graft copolymers are of great importance and widely used in various fields Natural polysaccharides have recently received more attention due to their advantages over synthetic polymers by being non toxic biodegradable and

available at low cost Modification of polysaccharides through graft copolymerization improves the properties of polysaccharides Grafting is known to improve the characteristic properties of the backbones Such properties include water repellency thermal stability flame resistance dye ability and resistance towards acid base attack and abrasion Polysaccharides and their graft copolymers find extensive applications in diversified fields Applications of modified polysaccharides include drug delivery devices controlled release of fungicides selective water absorption from oil water emulsions purification of water etc
