Regular And Chaotic Dynamics:

Regular and Chaotic Dynamics A.J. Lichtenberg, M.A. Lieberman, 2013-03-14 What's in a name The original title of our book *Regular and Stochastic Motion* was chosen to emphasize Hamiltonian dynamics and the physical motion of bodies The new edition is more evenhanded with considerably more discussion of dissipative systems and dynamics not involving physical motion To reflect this partial change of emphasis we have substituted the more general terms in our title The common usage of the new terms clarifies the emphasis of the book The main change in the book has been to expand the sections on dissipative dynamics including discussion of renormalization circle maps intermittency crises transient chaos multifractals reconstruction and coupled mapping systems These topics were either mainly in the mathematical literature or essentially unstudied when our first edition was written The volume of work in these areas has surpassed that in Hamiltonian dynamics within the past few years We have also made changes in the Hamiltonian sections adding many new topics such as more general transformation and stability theory connected stochasticity in two dimensional maps converse KAM theory new topics in diffusion theory and an approach to equilibrium in many dimensions Other sections such as mapping models have been revised to take into account new perspectives We have also corrected a number of misprints and clarified various arguments with the help of colleagues and students some of whom we acknowledge below We have again chosen not to treat quantum chaos partly due to our own lack of acquaintance with the subject

Laser Spectroscopy of Highly Vibrationally Excited Molecules Vladilen Stepanovich Letokhov,2021-07-29 Laser spectroscopy has been perfected over the last fifteen years to become a precise tool for the investigation of highly vibrationally excited molecules Intense infrared laser radiation permits both the multiple photon resonant excitation and the dissociation of polyatomic molecules In this book the latest results of some of the foremost Soviet researchers are published for the first time in the West Laser Spectroscopy of Highly Vibrationally Excited Molecules contains a comprehensive study of both the experimental and theoretical aspects of the basic photophysical interactions that occur in these processes The book first focuses on the nonlinear interaction between the resonant vibrational mode and the intense infrared field and then examines the nonlinear interaction between the vibrational modes themselves due to anharmonicity These interrelated processes determine all the characteristics of polyatomic molecules in an infrared field The book also discusses related phenomena such as spectra broadening optical resonance photon echoes and dynamical chaos It includes examples of multiple photon resonant excitation such as the excitation of OsO₄ by CO O₂ laser radiation which is detected by the visible luminescence that results This book will be of great interest to researchers and postgraduate students in infrared laser spectroscopy and the laser chemistry of molecules and applications of isotope separation Ultra-high-q Optical

Microcavities Yun-feng Xiao,Chang-ling Zou,Qihuang Gong,Lan Yang,2020-10-29 Confinement and manipulation of photons using microcavities have triggered intense research interest in both basic and applied physics for more than a decade Prominent examples are whispering gallery microcavities which confine photons by means of continuous total internal reflection along a curved and smooth surface The long photon lifetime strong field confinement and in plane emission characteristics make them promising candidates for enhancing light matter interactions on a chip In this book we will introduce different ultra high Q whispering gallery microcavities and focus on their applications in enhancing light matter
