Rehabilitation Of Lower Limb Amputees:

Lower Limb Amputations Gloria T. Sanders, Bella J. May, 1986 The primary initial effort in every case of disease or injury should be to save the extremity Amputation is seldom necessary following bone and joint injuries More often it is an admission of defeat in the medical management of the patient with vascular disease In such cases it should be performed only as a last resort The longest possible lever arm consistent with primary healing should be maintained for maximum proprioceptive and kinesthetic feedback and thus rehabilitation potential **Limb Amputation** R. Ham, L. T.

Cotton, 2013-12-20 The majority of amputations in the western world today are due to vascular disease Despite the advances in surgical treatment of this disease particularly by reconstruction it is a sad fact that the number of amputations performed in these countries each year for vascular disease is increasing Most of these amputees are elderly and their life expectancy is short so it is important that the treatment and rehabilitation that they receive is informed appropriate efficient and swift to enable them to return successfully to life in the community for their remaining years Management of this group of patients has proved to be successful only if a multidisciplinary team approach is adopted Until recently in the UK this approach sadly has only been implemented by a few centres However with the publication of the McColl report into the prosthetic and wheelchair service in 1986 interest in the care of the amputee is growing throughout the country This book covers all aspects of amputation from disease and diagnosis to rehabilitation and community discharge with emphasis on the management of the largest group the vascular lower limb amputee A team approach is described and emphasized as being essential for good results and subsequent successful return into the community The role of each of the important disciplines is described in relation to the appropriate part of the rehabilitation phase **Lower Limb Amputation** Adrian Cristian M. D., Adrian

Current Bibliographies in Medicine, 1988 Comprehensive Management of the Upper-Limb Amputee Diane J. Atkins, Robert H. III Meier, 2012-12-06 Each year in the United States an estimated 40 000 persons lose a limb Of these

amputees approximately 30% lose a hand or an arm This loss is most frequently related to trauma occurring in the healthy young adult male and is often work related Approximately 3% of all amputees are born with congenital limb absence In children the ratio of congenital to acquired amputation is 2 1 and the ratio of upper limb to lower limb amputees is 1 2 1 Therefore since relatively few amputations result in upper limb loss only a small number of health practitioners even those specializing in amputee rehabilitation have the opportunity to provide services for a significant number of arm amputees As a result clinicians need to share their experiences so that the full range of options for optimum care and rehabilitation of the patient population may be considered To meet this challenge for wider communication of clinical experience a group of upper limb amputee specialists met in Houston Texas in 1981 to serve as the core faculty for a course entitled Contemporary Issues in Upper Extremity Amputation and Prosthetic Function This program provided the opportunity for surgeons physiatrists engineers prosthetists social workers psychologists occupational therapists and physical therapists from the United States and Canada to discuss their extensive experience in working with upper extremity amputees A second conference continuing the discussion of upper limb amputee rehabilitation was held one year later Journal of Rehabilitation Research & Development ,1983
