Abstract

In this paper, for arbitrary sufficiently small deformations, the propagation of the acceleration waves in isotropic and homogeneous materials is discussed in the context of second-order elasticity by using a perturbation method. This method allows us to determine the first-order terms of the speeds as well as the amplitudes both of the principal waves and the waves in any arbitrary direction of propagation, when the undisturbed region is subjected to an arbitrary deformation. Finally, some numerical results are presented in some conventional Mooney-Rivlin materials.

Keywords: Acceleration waves, nonlinear elasticity, perturbation method, second-order effects, principal waves.

1. Introduction.

The study of the propagation of acceleration waves in nonlinear, elastic, isotropic, and homogeneous media, has been, and remains, a topic of great interest in many areas of the physical sciences. However, general results in finite elasticity have only been obtained for *principal waves*, i.e., for the ordinary waves which propagate along the *principal axes of strain* (see [1], [2] which contain detailed references to other contributions). These waves, when they exist, can only be longitudinal or transverse, and if the form of the stress relation is known, then *Ericksen's formulae* supply the unique value of their speeds. Conversely, if these speeds are known functions of the three principal stretches, for example by experiments, then the response coefficients are uniquely determined. All that supplies the first simple and definite connection between the existence of principal waves and physically reasonable static response of an elastic isotropic material in finite deformations (see [1] p.278-294).
