Equilibrium Christopher Wills explains the rules by which ecosystems maintain a diversity of interdependent species in particular the balance of predators and prey Wills is both an eminent academic and a hugely experienced field biologist In presenting the concept of green equilibrium he draws on a fascinating range of examples including coral reefs off the densely populated Philippines the isolated and densely forested valleys of Papua New Guinea the changing Himalayan kingdom of Bhutan and a Californian ranch being allowed to return to a wild state In each case he assesses the impact of modern changes and attempts at conservation on these delicately balanced ecosystems Wills shows how human populations too are an integral part of the picture We now know from genetic evidence that over the course of history as humans spread out of Africa populations adapted as a result of environmental conditions Striking new evidence indicates that some human populations carry genes from past encounters with other hominids Neanderthals and Denisovans as well as genetic adaptations to local hazards such as malaria Wills argues that the most effective approaches to conserving green equilibria come out of evolutionary insights and from close involvement of the local communities who have lived and adapted to them

**Quaternary Extinctions** Paul S. Martin,Richard G. Klein,2022-01-04 What caused the extinction of so many animals at or near the end of the Pleistocene Was it overkill by human hunters the result of a major climatic change or was it just a part of some massive evolutionary turnover Questions such as these have plagued scientists for over one hundred years and are still being heatedly debated today Quaternary Extinctions presents the latest and most comprehensive examination of these questions Geological Magazine May be regarded as a kind of standard encyclopedia for Pleistocene vertebrate paleontology for years to come American Scientist Should be read by paleobiologists biologists wildlife managers ecologists archeologists and anyone concerned about the ongoing extinction of plants and animals Science Uncommonly

readable and varied for watchers of paleontology and the rise of humankind Scientific American Represents a quantum leap in our knowledge of Pleistocene and Holocene palaeobiology Many volumes on our bookshelves are destined to gather dust rather than attention But not this one Nature Two strong impressions prevail when first looking into this epic compendium One is the judicious balance of views that range over the whole continuum between monocausal cultural or environmental explanations The second is that both the data base and theoretical sophistication of the protagonists in the debate have improved by a quantum leap since 1967 American Anthropologist *Last of the Wild* Robert M.
