**Polymer Networks** American Chemical Society, American Chemical Society, Symposium on Highly Cross-Linked Polymer Networks Staff, 1971      **Polymer Networks** A. Chompff, 2013-06-29 For several decades polymer science has sought to rationalize the mechanical and thermodynamic properties of polymer networks largely within the framework of statistical thermodynamics Much of this effort has been directed toward the rubbery rather than the glassy state It is generally assumed that networks possess an average composition to which average properties may be assigned from such a continuum view a powerful analysis of such properties as modulus swelling birefringence and thermoelasticity has emerged In the years following the rise of polymer characterization the late 40 s and early 50 s many scientists began to study apparent relations between the properties of linear polymer molecules and the networks obtainable therefrom This search was also stimulated by the wide range of applications of polymer networks in commercial elastomers thermosets and coatings Frequently these data were confidently matched with curves obtained from statistically describable models of networks of ghost chains uniformly distributed in space More recently it has become apparent that polymer chains in networks are not as ideal as assumed in the formulation of statistical models and there has been a shift in emphasis towards the less than ideal perturbed and possibly inhomogeneous networks which are more frequently encountered in practice The continuum approach however had to be developed before inhomogeneous systems could be described the present volume therefore contains both views
