Offshore Structures Günther Clauss, Eike Lehmann, Carsten Østergaard, 2012-12-06 This is the second part of the translation of the original German text *Meerestechnische Konstruktionen* which was published by Springer Verlag in 1988 The translated material is a reviewed and updated version of the German text Whereas the first volume concentrates on general and external factors this one focuses on factors affecting the design and analysis of offshore structures themselves In an effort to address a wide audience the topic is presented in a general context Therefore it introduces students and practising engineers to the field of marine technology and at the same time serves as a reference book for experts Finally it gives specialists in related fields an idea of where their work on individual problems of offshore structures stands in relation to the field as a whole *Offshore Structures Vol 2* is based on the authors lectures and design practice in offshore structures and their components It assists the reader in developing practical solutions by introducing a large number of examples and reference is made to further specialised literature

Stochastic Finite Elements: A Spectral Approach Roger G. Ghanem, Pol D. Spanos, 2012-12-06 This monograph considers engineering systems with random parameters Its context format and timing are correlated with the intention of accelerating the evolution of the challenging field of Stochastic Finite Elements The random system parameters are modeled as second order stochastic processes defined by their mean and covariance functions Relying on the spectral properties of the covariance function the Karhunen Loeve expansion is used to represent these processes in terms of a countable set of uncorrelated random variables Thus the problem is cast in a finite dimensional setting Then various spectral approximations for the stochastic response of the system are obtained based on different criteria Implementing the concept of Generalized Inverse as defined by the Neumann Expansion leads to an explicit expression for the response process as a multivariate polynomial functional of a set of uncorrelated random variables Alternatively the solution process is treated as an element in the Hilbert space of random

functions in which a spectral representation in terms of the Polynomial Chaos is identified In this context the solution process is approximated by its projection onto a finite subspace spanned by these polynomials Probabilistic Methods for Structural Design Carlos Guedes Soares, 2012-12-06 This book contains contributions from various authors on different important topics related with probabilistic methods used for the design of structures Initially several of the papers were prepared for advanced courses on structural reliability or on probabilistic methods for structural design These courses have been held in different countries and have been given by different groups of lecturers They were aimed at engineers and researchers who already had some exposure to structural reliability methods and thus they presented overviews of the work in the various topics The book includes a selection of those contributions which can be of support for future courses or for engineers and researchers that want to have an update on specific topics It is considered a complement to the existing textbooks on structural reliability which normally ensure the coverage of the basic topics but then are not extensive enough to cover some more specialised aspects In addition to the contributions drawn from those lectures there are several papers that have been prepared specifically for this book aiming at complementing the others in providing an overall account of the recent advances in the field It is with sadness that in the meanwhile we have seen the disappearance of two of the contributors to the book and in fact two of the early contributors to this field Characterisation and Engineering Properties of Natural Soils, Two Volume Set T.S.
