**Secondary Metabolism and Cell Differentiation** M. Luckner, L. Nover, H. Böhm, 2013-06-29 1 Secondary Metabolism and Differentiation In addition to the primary metabolic reactions which are similar in all living beings formation and breakdown of nucleic acids and proteins as well as of their precursors of most carbohydrates of some carboxylic acids etc a vast number of metabolic pathways lead to the formation of compounds peculiar to a few species or even to a single chemical race only These reactions in accord with CZAPEK 1921 and PAECH 1950 are summed up under the term secondary metabolism and their products are called secondary metabolites The wide variety of secondary products formed in nature includes such well known groups as alkaloids antibiotics cardiac glycosides tannins saponins volatile oils and others A considerable number of them are of economic importance in therapeutics or technology Although secondary products are produced by micro organisms higher plants and animals cf LUCKNER 1972 most of the substances are found in the plant kingdom The lack of mechanisms for true excretion in higher plants may result in this unequal distribution the waste products of metabolism in plants instead being accumulated in the vacuoles the cell walls or in special excretory cells or spaces of the organism metabolic excretion cf FREY WYSSLING 1935 1970 MOTHES 1966a b 1972 LUCKNER et al 1976 Many secondary substances have however a direct biologic function They can be regulatory effectors e g

Molecular Genetics of Fungal Secondary Metabolites Juan-Francisco Martín, Carlos García-Estrada, Susanne Zeilinger, 2014-09-09 This volume describes the more relevant secondary metabolites of different fungi with current information on their biosynthesis and molecular genetics Bolstered with color illustrations and photographs the book describes the possible application of molecular genetics to directed strain improvement in great detail The needs for future developments in this field are also discussed at length Written by authorities in the field Biosynthesis and Molecular Genetics of Fungal Secondary Metabolites provides a cutting edge perspective on fungal secondary metabolism and underlying genetics and is a valuable resource for scientists researchers and educators in the field of fungal biology     **Dynamic Aspects Of Natural Products Chemistry** Takeshi Ogura, 1997-11-21 Preface Natural products chemistry has a long history and could be regarded as having its roots in the use of many kinds of herbal mixtures as crude drugs in traditional medicine Systems of traditional medicine have been practiced in China and Japan for thousands of years and virtually all regions of the world have used natural materials to treat human disease It was clear that many plants herbs etc contain components with powerful biological activities The dawn of modern natural products chemistry began with the isolation of the active component morphine from opium Subsequently various alkaloids were isolated from medicinal plants and employed clinically The discovery and the development of penicillin as a microbial metabolite opened up the era of antibiotics which have saved countless lives in the past half century or so The isolation and synthesis of steroid hormones resulted in the development of new concepts in molecular stereochemistry and organic synthetic techniques as did the discovery of bioactive lipids such as prostaglandins and leukatrienes bioactive peptides such as enkephalins and endetherines and oligosaccharides including glycoproteins Further the discovery of plant hormones has led to great strides in plant biotechnology including plant tissue cultures and derivatives of insect hormones and pheromones are now used as pesticides Thus applications of natural products chemistry have become all pervasive in modern society Apart from the extensive practical applications of natural products and their derivatives natural products chemistry has played a central role in the development of modern organic chemistry as a result of its focus on structural and synthetic studies of often highly complex and inaccessible molecules Biosynthetic studies have also attracted much attention aiming to answer the questions of why and how such a large number and variety of compounds are synthesised by organisms Researchers in the field of biosynthesis first focused on elucidation of the pathways of secondary metabolism and then on the mechanisms of the enzymes catalyzing the biosynthetic reactions This was an extremely difficult task because rather large amounts of enzymes are required for the investigation of reaction mechanisms and the enzyme proteins are often unstable and not easy to purify However in recent years the development of molecular biology has made gene and protein engineering rather routine Thus studies of mechanistic enzymology can now be conducted with cloned and overexpressed enzyme proteins It has been shown that the enzymes responsible for the biosynthesis of antibiotics in *Streptomyces* spp are encoded in gene clusters Further cloning and functional analysis of the

genes associated with flavonoid biosynthesis should soon cast light on the interesting question of why flavonoids are ubiquitously present in plant leaves Life is maintained not only by large molecules such as proteins and nucleic acids but also by many small molecules which have essential and diverse roles in the physiology of living organisms Such compounds often have highly specific interactions with target receptors but the mechanisms involved largely remain to be explored Current methodology means that this task can be addressed and this in turn should lead to a host of new applications for natural products and their derivatives The key may be an interdisciplinary approach taking account of both biological function and molecular behaviour based on precise structure recognition As we increasingly understand the mechanisms of molecular recognition that operate in nature many possibilities should open up for artificial control or modification of biological functions as well as new challenges for synthetic organic chemists Our intention in this book is to focus on such dynamic aspects of natural products chemistry By dealing in detail with representative topics to which the most modern techniques of research have been applied we hope to emphasize the value of combining traditional approaches to natural products chemists with current biochemical and molecular biological ideas Each chapter provides sufficient background information and experimental detail to make the subject accessible to non specialists It is our hope that these examples of recent progress in key areas of natural products chemistry will stimulate work in related topics by illustrating the power of a modern interdisciplinary approach to the subject Revue roumaine de biochimie ,1978

**Dietary Supplements of Plant Origin** Massimo Maffei,2003-05-22 Dietary supplements are estimated to be used regularly by almost 60% of the American population and over 300 million people worldwide An important and ever growing portion of this market is in botanical supplements that are derived from natural plants Natural however does not necessarily mean safe and although plants can provide health essential and health improving nutrients they can also provide toxic compounds While the use and sales of botanical supplements continues to expand rapidly scientific understanding of the efficacy and safety of these products remains limited The aim of Dietary Supplements of Plant Origin is to give both the general and specialized reader a comprehensive insight into the most recent findings in this interesting area of dietary supplementation It is hoped that this book will shed a new light on this topic and impact positively upon the health of people in this new millennium
