Second-Generation HTS Conductors Amit Goyal, 2006-06-26 The third method invented is called the Rolling assisted biaxially textured substrates RABiTS The book is divided into four sections The first section discusses the three methods to fabricate biaxially textured substrates upon which epitaxial YBCO or other HTS materials can be deposited to realize a single crystal like HTS wire The second section includes chapters on various methods of HTS deposition such as pulsed laser ablation PLD thermal co evaporation sputtering pulsed electron beam deposition ex situ BaF₂ by co evaporation followed by annealing chemical solution based ex situ processes jet vapor deposition metal organic chemical vapor deposition MOCVD and liquid phase epitaxy LPE The third section includes detailed chapters on other HTS materials such as the various Tl based and Hg based conductors These Second Generation HTS conductors also referred to as Coated conductors represent one of the most exciting developments in HTS technology

Letnji almanah Ošišanog ježa, 1936 *Second-generation Hts Conductors* Amit Goyal, 2004-10-01 [Advances in High Temperature Superconductors and their applications](#) S. MOHAN, 2019-06-20 Prof Heike Kamerlingh Onnes discovered superconductivity while measuring resistivity of mercury Surprisingly the resistivity of mercury ceased at 4.2 K and this phenomenon was known as superconductivity He realized the importance of this discovery in producing large magnetic fields It was realized that superconductivity is in a new thermodynamic state with peculiar electric and magnetic properties This paved the way to discover more superconductors Simple elements such as Tin Indium or lead showed the highest critical temperature $T_c = 7.2$ K They were called as Type I superconductors Niobium nitride was found to superconduct at 16 K at 1941 and Vanadium silicon showed superconductive properties at 17.5 K at 1953 Nb alloys and binary or more complex compounds such as Nb₃Sn $T_c = 18$ K Nb Ti $T_c = 9$ K Ga V with $T_c = 23$ K became type II superconductors Thereafter there was not much improvement in the development of superconductor although wonderful applications were expected from superconductors After three decades Fullerenes like ceramic superconductors are discovered A decade ago MgB₂ was discovered with $T_c = 39$ K These superconductors were routinely produced into form of wires for producing larger magnetic fields In all these cases cooling was effectively done by liquid Helium A comprehensive microscopic theory of superconductivity in metals was proposed in 1957 by John Bardeen Leon Cooper and Robert Schrieffer the so called BCS theory for which they received the Nobel Prize in Physics In a major breakthrough George Bednorz and Karl Mueller discovered a brittle ceramic superconductivity in the family of cuprates at 30 K in 1986 and a new era began Inspired by the work of Bednorz and Mueller on high temperature superconductivity HTS Paul Chu and his associates at the University of Houston discovered in 1987 123 compounds That is YBCO Yttrium¹ Barium² Copper³ Oxygen⁷ and iso structural RBCO Rare earth¹ Barium² Copper³ Oxygen⁷ have a T_c of 93 K Prior to 1987 all superconducting materials had lower critical temperatures T_c s and therefore functioned only at temperatures near the boiling point of liquid helium 4.2 K or liquid hydrogen 20.28 K with the highest being Nb₃Ge at 23 K They were known as low

temperature superconductors YBCO was the first material to become superconducting above 77 K boiling point of liquid nitrogen and subsequently a series of high temperature superconducting materials were discovered These superconducting materials are widely known as High temperature superconductors as these T_c s exceeded the limit prescribed by BCS theory HTSCs are potentially valuable as liquid nitrogen is cheaper than liquid helium YBCO possesses superior superconducting and physical properties YBCO receiver coils in NMR spectrometers have improved the resolution NMR spectrometers by a factor of 3 compared to that achievable with conventional coils Paul Chu s group holds the current T_c record of 164 K in the mercury barium based cuprate superconductor under pressure Their work led to a rapid succession of new high temperature superconducting materials ushering in a new era in material science chemistry and technology Added to this the structure of $\text{Bi}_2\text{Sr}_2\text{Ca}_2\text{Cu}_2\text{O}_{10}$ BiSCCO high temperature superconductive compound having T_c 110 K was reported In 1993 mercuric cuprates perovskite ceramic superconductors with the transition temperatures T_c 138 K was also reported *Advanced X-ray Techniques in Research and Industry* Ashok Kumar Singh,2005 Papers presented at the seminar held in Defence Metallurgical Research Laboratory Hyderabad India in 2003 **Superconductors** A. presence and effects of plastics in freshwaters has increased in the recent years The occurrence of plastics within inland lakes and rivers as well as their biota has been demonstrated Experiments with freshwater organisms have started to explore the direct and indirect effects resulting from plastic exposure There is a clear need for further research and a dedicated space for its dissemination This book is devoted to highlighting current research from around the world on the prevalence fate and effects of plastic in freshwater environments

100 Years of Superconductivity Horst Rogalla, Peter H. Kes, 2011-11-11 Even a hundred years after its discovery superconductivity continues to bring us new surprises from superconducting magnets used in MRI to quantum detectors in electronics 100 Years of Superconductivity presents a comprehensive collection of topics on nearly all the subdisciplines of superconductivity Tracing the historical developments in supe

Materials for Sustainable Energy Applications David Munoz-Rojas, Xavier Moya, 2017-03-27 The impending energy crisis brought on by the running out of finite and non homogenously distributed fossil fuel reserves and the worldwide increase in energy demand has prompted vast research in the development of sustainable energy technologies in the last few decades However the efficiency of most of these new technologies is relatively small and therefore it needs to be increased to eventually replace conventional technologies based on fossil fuels The required efficiency increase primarily relies on the ability to improve the performance of the functional materials which are at the heart of these technologies The purpose of this book is to give a unified and comprehensive presentation of the fundamentals and the use and design of novel materials for efficient sustainable energy applications such as conversion storage transmission and consumption The book presents general coverage of the use and design of advanced materials for sustainable energy applications Thus the book addresses all the relevant aspects such as materials for energy conversion storage transmission and consumption

High Temperature Superconductors Raghu N. Bhattacharya, M. Parans Paranthaman, 2011-08-24 This essential reference provides the most comprehensive presentation of state of the art research being conducting worldwide today in this growing field of research and applications HTS are currently being supported by numerous governmental and industrial initiatives in the USA and Asia and Europe to overcome energy distribution issues and are now being commercialised for power delivery devices such as power transmission lines and cables motors and generators Applications in electric utilities include energy storing devices to help industries avoid dips in electric power current limiters and long transmission lines The technology is particularly thought out for highly populated and densed areas Both editors are leading experts in the field from the National Renewable Energy Laboratory and the Oak Ridge National Laboratory This book can be used as a companion teaching tool and also as as a research and professional reference

Prospective Life Cycle Assessment of High-Temperature Superconductors for Future Grid Applications Buchholz, Alexander, 2022-07-27 High temperature superconductors have distinct advantages compared to conventional conductors Below their critical temperature superconductors have immeasurably low ohmic losses To maintain the superconducting state superconductors require constant cooling This study aims at identifying the
