Molecular Genetics of Host-Specific Toxins in Plant Disease Keisuke Kohmoto, Olen C. Yoder, 1998-03-31

For investigators engaged in the study of toxins generally and host specific toxins in particular it is a rare treat to attend a meeting in which toxins involved in plant pathogenesis are emphasized A gathering of this type provides opportunity to consider the discovery of new toxins their chemical structures genes encoding enzymes that control their biosyntheses their sites of action and physiological effects on plants and their roles if any in pathological processes Having acknowledged the inspiration fostered by a toxin meeting however it is important to point out that the program of this symposium was generously sprinkled with nontoxin talks These contributions generated cross disciplinary discussion and promoted new ways of thinking about relationships among factors required for plant disease development The point can be illustrated by considering just one example We have in the past often regarded diseases mediated by host specific toxins and diseases involving gene for gene relationships as representing two different classes of fungal plant interaction This is largely because the key molecular recognition event in so called toxin diseases leads to compatibility whereas the corresponding event in gene for gene diseases leads to incompatibility Yet the race specific elicitors produced by the gene for gene fungi *Cladosporium fulvum* De Wit Adv Bot Res 21 147 185 1995 and *Rhynchosporium secalis* Rohe et al EMBO J
