1D and 2D Photonic Crystal Nanocavities for Semiconductor Cavity QED. Benjamin Colby Richards, 2011 The topic of this dissertation is photonic crystal nanocavities for semiconductor cavity quantum electrodynamics For the purposes of this study these nanocavities may be one dimensional 1D or two dimensional 2D in design The 2D devices are active and contain embedded InAs quantum dots QDs whereas the 1D devices are passive and contain no active emitters The 2D photonic crystal nanocavities are fabricated in a slab of GaAs with a single layer of InAs QDs embedded in the slab When a cavity mode substantially overlaps the QD ensemble the dots affect the linewidths of the observed modes leading to broadening of the linewidth at low excitation powers due to absorption and narrowing of the linewidths at high excitation powers due to gain when the QD ensemble absorption is saturated We observe lasing from a few QDs in such a nanocavity A technique is discussed which allows us to tune the resonance wavelength of a nanocavity by condensation of an inert gas onto the sample which is held at cryogenic temperatures The structural quality at the interfaces of epitaxially grown semiconductor heterostructures is investigated and a growth instability is discovered which leads to roughness on the bottom of the GaAs slabs Adjustment of MBE growth parameters leads to the elimination of this roughness and the result is higher nanocavity quality factors A number of methods for optimizing the fabrication of nanocavities is presented which lead to higher quality factors It is shown that some fundamental limiting factor not yet fully understood is preventing high quality factors at wavelengths shorter than 950 nm Silicon 1D devices without active emitters are investigated by means of a tapered microfiber loop and high quality factors are observed This measurement technique is compared to a cross polarized resonant scattering method The quality factors observed in the silicon nanocavities are higher than those observed in GaAs consistent with our observation that quality factors are in general higher at longer wavelengths

Cavity Quantum Electrodynamics in Semiconductor Laser Y. Yamamoto, R. Horowicz, S. Machida, G. Björk, W. H. Richardson, NIPPON TELEGRAPH AND TELEPHONE CORP TOKYO., 1992 A one dimension planar microcavity structure shown in can increase the coupling efficiency Beta of spontaneous emission into a single cavity resonant mode if the spontaneous emission spectral width $\Delta\omega$ is smaller than the microcavity resonance width $\Delta\omega_c$ and if the refractive index difference Δn is fairly large The loss of spontaneous emission into spurious modes 1 Beta are clue to the two degenerate

orthogonal polarization modes and the leaky guided modes propagating in a plane of the microcavity A three dimensional waveguide microcavity structure shown in features several advantages over the one dimensional structure The increase in β is realized without requiring $\Delta\omega_{\text{sub e}}$ $\Delta\omega_{\text{sub c}}$ and large Δn The degeneracy of the two orthogonal polarization modes can be lifted and the leaky guided modes can be made cut off by the waveguide structure Therefore the spurious spontaneous emission into these modes can be suppressed The spontaneous emission lifetime T can be also decreased in the three dimensional microcavity On the other hand the one dimensional microcavity cannot decrease $\tau_{\text{sub } \Delta}$ but can only increase $\tau_{\text{sub } \Delta}$

Optical Generation and Control of Quantum Coherence in Semiconductor Nanostructures Gabriela Slavcheva, Philippe Roussignol, 2010-06-01 The fundamental concept of quantum coherence plays a central role in quantum physics cutting across disciplines of quantum optics atomic and condensed matter physics Quantum coherence represents a universal property of the quantum systems that applies both to light and matter thereby tying together materials and phenomena Moreover the optical coherence can be transferred to the medium through the light matter interactions Since the early days of quantum mechanics there has been a desire to control dynamics of quantum systems The generation and control of quantum coherence in matter by optical means in particular represents a viable way to achieve this longstanding goal and semiconductor nanostructures are the most promising candidates for controllable quantum systems Optical generation and control of coherent light matter states in semiconductor quantum nanostructures is precisely the scope of the present book Recently there has been a great deal of interest in the subject of quantum coherence We are currently witnessing parallel growth of activities in different physical systems that are all built around the central concept of manipulation of quantum coherence The burgeoning activities in solid state systems and semiconductors in particular have been strongly driven by the unprecedented control of coherence that previously has been demonstrated in quantum optics of atoms and molecules and is now taking advantage of the remarkable advances in semiconductor fabrication technologies A recent impetus to exploit the coherent quantum phenomena comes from the emergence of the quantum information paradigm

measurement setup which is the accuracy to which the optical coupling level and optical losses are known relative to typical free space excitation techniques This allows for precise knowledge of the intracavity photon number and measurement of absolute transmitted and reflected signals Resonant optical spectroscopy of the system under both weak and strong driving conditions are presented which when compared with a quantum master equation model of the system allows for determination of the coherent coupling rate between QD exciton and optical cavity mode the different levels of elastic and inelastic dephasing of the exciton state and the position and orientation of the QD within the cavity Pump probe measurements are also performed in which a far off resonant red detuned control laser beam is introduced into the cavity Rather than producing a measurable ac Stark shift in the exciton line of the QD we find that this control beam induces a saturation of the resonant system response The broad photoluminescence spectrum resulting from the presence of the control beam the cavity points to sub band gap absorption in the semiconductor and the resulting free carrier generation as the likely source of system saturation

Applied Asymptotic Expansions in Momenta and Masses Vladimir A. Smirnov,2003-07-01 The sturgeon they sent was second grade fresh said the barman Really what nonsense Why nonsense Second grade fresh that s what I call nonsense There s only one degree of freshness the first and it s the last M A Bulgakov The Master and Margarita The goal of this book is to describe in detail how Feynman integrals can be expanded in suitable parameters when various momenta or masses are small or large In a narrow sense this problem is connected with practical calculations In a situation where a given Feynman integral depends on parameters of very different scales a natural idea is to replace it by a sufficiently large number of terms of an expansion of it in ratios of small and large scales It will be explained how this problem of expansion can be systematically solved by formulating universal prescriptions that express terms of the expansion by using the original Feynman integral with its integrand expanded into a Taylor series in appropriate momenta and masses It turns out that knowledge of the structure of the asymptotic expansion at the diagrammatic level is a key point in understanding how to perform expansions at the operator level There are various examples of these expansions the operator product expansion the large mass expansion Heavy Quark Effective Theory Non Relativistic QCD etc Each of them serves as a realization of the factorization of contributions of different scales
