Psychophysics Beyond Sensation Christian Kaernbach, Erich Schröger, Hermann Müller, Hermann Müller, Erich Schröger, 2004-05-20 This volume presents a series of studies that expand laws invariants and principles of psychophysics beyond its classical domain of sensation This book's goal is to demonstrate the extent of the domain of psychophysics ranging from sensory processes through sensory memory and short term memory issues to the interaction between sensation and action The dynamics and timing of human performance are a further important issue within this extended framework of psychophysics Given the similarity of the various cortical areas in terms of their neuroanatomical structure it is an important question whether this similarity is paralleled by a similarity of processes These issues are addressed by the contributions in the present volume using state of the art research methods in behavioral research psychophysiology and mathematical modeling The book is divided into four sections Part I presents contributions concerning the classical domain of psychophysical judgment The next two parts are concerned with elementary and higher order processes and the concluding section deals with psychophysical models The sections are introduced by guest editorials contributed by independent authors These editorials present the authors personal view on the respective section providing an integrated account of the various contributions or highlighting their focus of interest among them While also voicing their own and sometimes different point of view they contribute to the process of discussion that makes science so exciting This volume should be of great interest to advanced students in neuroscience cognitive science psychology neuropsychology and related areas who seek to evaluate the range and power of psychological work today Established scientists in those fields will also appreciate the variety of issues addressed within the same methodological framework and their multiple interconnections and stimulating cross talk

Principles of Receptor Physiology Werner R. Loewenstein, 2013-03-07 Why should there be a handbook of sensory physiology and if so why now The editors have asked this question marshalled all of the arguments that seemed to speak against their project and then discovered that most of these arguments really spoke in favor of it there seemed to be no doubt that the attempt should be made and that it should be made now No complete overview of sensory physiology has been attempted since Bethe's Handbuch der normalen und pathologischen Physiologie nearly forty years ago Since then the field has evolved with unforeseen rapidity Although electric probing of single peripheral nerve fibers was begun by ADRIAN and ZOTTERMAN as early as 1926 in the somatosensory system and extended to single optic nerve fibers by HARTLINE in 1932 the real upsurge of such single unit studies has only come during the last two decades Single cell electrophysiology has now been applied to all sensory modalities and on almost every conceivable phylogenetic level It has begun to clarify peripheral receptor action and is adding to our understanding of the central processing of sensory information In parallel with these developments there have been fundamental studies of the physics and chemistry of the receptors themselves these studies are leading to insights into the mechanisms of energy transduction and nerve impulse initiation

Sensing Brain: The Role of Sensation in Rehabilitation and Training Susan Hillier, Geert Verheyden, Jane E. Sullivan, LeeAnne Mary Carey, 2021-03-04 Bioaccessibility and Digestibility of Lipids from Food Myriam M.-L. Grundy, Peter J. Wilde, 2021-01-19

The structure of a food influences the way it is transformed during processing and digestion. This in turn has an impact on nutrient bioaccessibility, release and digestibility, and subsequently on the physiological response and health of the individual who consumes that food. Although evidence exists on the health benefits associated with the inclusion of certain lipid-rich foods (e.g. nuts, dairy products and fish) in the diet, the mechanisms that explain the physiological effects and the long-term benefits are not well understood. Lipids in themselves have many beneficial health effects: they are a source of energy and essential fatty acids; they are structural components of cell membranes; they are required to solubilise fat-soluble compounds; and they serve as precursors of hormones. In addition, the overall structure of the food containing the lipids plays a crucial role in determining health benefits, notably by influencing lipid bioaccessibility and digestibility. *Bioaccessibility and digestibility of lipids from food* uniquely focuses on the physico-chemical properties of lipids and lipid-rich food, as well as the subsequent effects on human health. Chapters from experts in food digestion examine food structure at both the macro and micro levels, covering lipids from plant and animal food products. The editors have developed the book for dietitians, nutritionists and food scientists. Clinicians and other health professionals, educators in nutrition and others working in the food industry will also find the material relevant.

Integrative Psychology William M & King Marston, 2020-03-26. First Published in 1999. This text is the author's attempt to organise the field of psychology for students. This volume makes a critical examination of various psychological and semi-psychological attempts to classify fundamental human activities and thereafter attempts to postulate elementary behaviour units which may serve psychology precisely as the atom and electron have served in chemistry.

Connectionist Models David S. Touretzky, Jeffrey L. Elman, Terrence J. Sejnowski, 2014-05-12. *Connectionist Models* contains the proceedings of the 1990 Connectionist Models Summer School held at the University of California at San Diego. The summer school provided a forum for students and faculty to assess the state of the art with regards to connectionist modeling. Topics covered range from theoretical analysis of networks to empirical investigations of learning algorithms, speech and image processing, cognitive psychology, computational neuroscience and VLSI design. Comprised of 40 chapters, this book begins with an introduction to mean-field Boltzmann and Hopfield networks, focusing on deterministic Boltzmann learning in networks with asymmetric connectivity, contrastive Hebbian learning in the continuous Hopfield model and energy minimization, and the satisfiability of propositional logic. Mean-field networks that learn to discriminate temporally distorted strings are described. The next sections are devoted to reinforcement learning and genetic learning, along with temporal processing and modularity. Cognitive modeling and symbol processing, as well as VLSI implementation, are also discussed. This monograph will be of interest to both students and academicians concerned with connectionist modeling.
