**Sheet Metal Machine Processes** Claude J. Zinngrabe, Fred W. Schumacher, 1975-01      **Sheet Metal Machine Processes** Claude J. Zinngrabe, 2010      *Modeling of Metal Forming and Machining Processes* Prakash Mahadeo Dixit, U.S. Dixit, 2008-05-14

The use of computational techniques is increasing day by day in the manufacturing sector. Process modeling and optimization with the help of computers can reduce expensive and time consuming experiments for manufacturing good quality products. Metal forming and machining are two prominent manufacturing processes. Both of these processes involve large deformation of elasto plastic materials due to applied loads. In metal forming the material is plastically deformed without causing fracture. On the other hand in machining the material is deformed till fracture in order to remove material in the form of chips. To understand the physics of metal forming and machining processes one needs to understand the kinematics of large deformation, dependence of deformation and its rate on displacement as well as the constitutive behavior of elasto plastic materials, dependence of internal forces on deformation and its rate. Once the physics is understood these phenomena have to be converted to mathematical relations in the form of differential equations. The interaction of the work piece with the tools, dies and other surroundings also needs to be expressed in a mathematical form known as the boundary and initial conditions. In this book the first four chapters essentially discuss the physics of metal forming and machining processes. The physical behavior of the work piece during the processes is modeled in the form of differential equations and boundary and initial conditions.

**Fundamentals of Machining Processes** Hassan Abdel-Gawad El-Hofy, 2013-08-06

Completely revised and updated this second edition of *Fundamentals of Machining Processes* Conventional and Nonconventional Processes covers the fundamentals machining by cutting, abrasion, erosion and combined processes. The new edition has been expanded with two additional chapters covering the concept of machinability and the roadmap for selecting machining processes that meet required design specification. See What's New in the Second Edition. Explanation of the definition of the relative machinability index and how the machinability is judged. Important factors affecting the machinability ratings. Machinability ratings of common engineering materials by conventional and nonconventional methods. Factors to be considered when selecting a machining process that meets the design specifications including part features, materials, product accuracy, surface texture, surface integrity, cost, environmental impacts and the process and the machine selected capabilities. Introduction to new Magnetic Field Assisted Finishing Processes. Written by an expert with 37 years of experience in research and teaching machining and related topics, this covers machining processes that range from basic conventional metal cutting, abrasive machining to the most advanced nonconventional and micromachining processes. The author presents the principles and theories of material removal and applications for conventional and nonconventional machining processes, discusses the role of machining variables in the technological characteristics of each process and provides treatment of current technologies in high speed machining and micromachining.
