Cumulated Index Medicus, 1999 **High Resolution Numerical Modelling of the Atmosphere and Ocean** Kevin Hamilton, Wataru Ohfuchi, 2007-12-25 Many key issues in dynamical meteorology and physical oceanography depend on interactions among diverse spatial scales Atmospheric examples are the role of small scale gravity waves in the zonal mean momentum balance in the middle atmosphere the role of tropical cyclones in the large scale energy and momentum balances of the troposphere or even the direction of spectral cascades of variance in the mesoscale In the ocean issues of this type include understanding the detailed physics of the very narrow boundary currents that occur along many coastlines and the role of mesoscale eddies in determining the strength of the large scale circulations and meridional ocean heat transports Truly comprehensive observational diagnostic studies of these issues are essentially impossible since they would require the global observational overage at extremely high spatial resolution An alternative is to study such issues in high resolution models that may span 3 or more orders of magnitude in terms of spatial scales There has been a great deal of progress recently on development and application of such fine resolution models This had been spurred in part by the recent availability of exceptionally powerful computers Noteworthy in this respect is the Earth Simulator in Yokohama Japan which commenced operations in 2002 and provides a peak performance of 40 Terraflops but competitive supercomputers for scientific applications are now becoming available in the USA and Europe as well There has developed in the last few years an increased understanding of the scientific value of results from very high resolution comprehensive numerical simulations This book documents the first international meeting focused specifically on high resolution atmospheric and oceanic modeling held at the Earth Simulator Center Rather than producing a standard conference proceedings it includes papers written by invited speakers at the meeting reporting on their most exciting recent results involving high resolution modeling

, **Basic and applied research on deception and its detection** Wolfgang Ambach, Matthias Gamer, 2014-08-07 Deception is a ubiquitous phenomenon in social interactions and has attracted a significant amount of research during the last decades The majority of studies in this field focused on how deception modulates behavioral autonomic and brain responses and whether these changes can be used to validly identify lies Especially the latter question which historically gave rise to the development of psychophysiological lie detection techniques has been driving research on deception and its detection until today The detection of deception and concealed information in forensic examinations currently constitutes one of the most frequent applications of psychophysiological methods in the field With the increasing use of such methods the techniques for detecting deception have been controversially discussed in the scientific community It has been proposed to shift from the original idea of detecting deception per se to a more indirect approach that allows for determining whether a suspect has specific knowledge of crime related details This so called Concealed Information Test is strongly linked to basic psychological concepts concerning memory attention orienting and response monitoring Although research in this field has

intensified with the advancement of neuroimaging techniques such as PET and fMRI in the last decade basic questions on the psychological mechanisms underlying modulatory effects of deception and information concealment on behavioral autonomic and brain responses are still poorly understood This Research Topic brings together contributions from researchers in experimental psychology psychophysiology and neuroscience focusing on the understanding of the broad concept of deception including the detection of concealed information with respect to basic research questions as well as applied issues This Research Topic is mainly composed of original research articles but reviews and papers elaborating on novel methodological approaches have also been included Experimental methods include but are not limited to behavioral autonomic electroencephalographic or brain imaging techniques that allow for revealing relevant facets of deception on a multimodal level While this Research Topic primarily includes laboratory work relevant issues for the field use of such methods are also discussed

The Chemistry of Synthetic Dyes V7 K Venkataraman,2012-12-02 The Chemistry of Synthetic Dyes Volume VII covers the synthesis and application of dyes fluorescent brightening agents color and electronic states of organic molecules photochemistry of dyes and physical chemistry of dyeing This book is organized into five chapters sulfur dyes Bunte salt dyes state of dye in dyebath and substrate kinetics equilibrium dye fiber affinity and mechanisms and applications of synthetic dyes to biological problems This compilation specifically discusses the sulfur dyes of known constitution analysis of sulfur dyes and chemistry of Bunte salts The chemical modification of proteins and dyes as antibacterial and therapeutic agents is also treated This volume is recommended for organic chemists and technologists interested in the synthesis of dyes and their applications **Branching Processes** Krishna B. Athreya,Peter E. Ney,2012-12-06 The purpose of this book is to give a unified treatment of the limit theory of branching processes Since the publication of the important book of T E Harris Theory of Branching Processes Springer 1963 the subject has developed and matured significantly Many of the classical limit laws are now known in their sharpest form and there are new proofs that give insight into the results Our work deals primarily with this decade and thus has very little overlap with that of Harris Only enough material is repeated to make the treatment essentially self contained For example certain foundational questions on the construction of processes to which we have nothing new to add are not developed There is a natural classification of branching processes according to their criticality condition their time parameter the single or multi type particle cases the Markovian or non Markovian character of the process etc We have tried to avoid the rather uneconomical and unenlightening approach of treating these categories independently and by a series of similar but increasingly complicated techniques The basic Galton Watson process is developed in great detail in Chapters I and II
