Singular Optimal Control Problems Mathematics In Science And Engineering Vol 117:

Singular Optimal Control Problems, 1975-10-29 In this book we study theoretical and practical aspects of computing methods for mathematical modelling of nonlinear systems A number of computing techniques are considered such as methods of operator approximation with any given accuracy operator interpolation techniques including a non Lagrange interpolation methods of system representation subject to constraints associated with concepts of causality memory and stationarity methods of system representation with an accuracy that is the best within a given class of models methods of covariance matrix estimation methods for low rank matrix approximations hybrid methods based on a combination of iterative procedures and best operator approximation and methods for information compression and filtering under condition that a filter model should satisfy restrictions associated with causality and different types of memory As a result the book represents a blend of new methods in general computational analysis and specific but also generic techniques for study of systems theory and its particular branches such as optimal filtering and information compression Best operator approximation Non Lagrange interpolation Generic Karhunen Loeve transform Generalised low rank matrix approximation Optimal data compression Optimal nonlinear filtering

Optimal Control of Nonlinear Processes Dieter Grass, Jonathan P. Caulkins, Gustav Feichtinger, Gernot Tragler, Doris A. Behrens, 2008-07-24 Dynamic optimization is rocket science and more This volume teaches how to harness the modern theory of dynamic optimization to solve practical problems not only from space flight but also in emerging social applications such as the control of drugs corruption and terror These innovative domains are usefully thought about in terms of populations incentives and interventions concepts which map well into the framework of optimal dynamic control This volume is designed to be a lively introduction to the mathematics and a bridge to these hot topics in the economics of crime for current scholars We celebrate Pontryagin's Maximum Principle that crowning intellectual achievement of human understanding and push its frontiers by exploring models that display multiple equilibria whose basins of attraction are separated by higher dimensional DNSS tipping points That rich theory is complemented by numerical methods available through a companion web site

Optimal Control: Novel Directions and Applications Daniela Tonon, Maria Soledad Aronna, Dante Kalise, 2017-09-01 Focusing on applications to science and engineering this book presents the results of the ITN FP7 SADCO network's innovative research in optimization and control in the following interconnected topics optimality conditions in optimal control dynamic programming approaches to optimal feedback synthesis and reachability analysis and computational developments in model predictive control The novelty of the book resides in the fact that it has been developed by early career researchers providing a good balance between clarity and scientific rigor Each chapter features an introduction addressed to PhD students and some original contributions aimed at specialist researchers Requiring only a graduate mathematical background the book is self contained It will be of particular interest to graduate and advanced undergraduate students industrial practitioners and to senior scientists wishing to update

Melton, 1993 *Optimization of Dynamical Systems with Impulse Controls and Shocks* Boris Miller, Evgeny Rubinovich, 2024-09-19 This text explores the state of the art in the rapidly developing theory of impulse control and introduces the theory of singular space time transformations a new method for studying shock mechanical systems Two approaches in the theory of impulse control are presented The first more traditional approach defines the impulsive action as a discontinuity of phase coordinates depending on the current time the state preceding the action and its magnitude The

second requires the use of modern methods for describing dynamical systems differential equations with measures The impulse is treated as an idealization of a very short action of high magnitude which produces an almost abrupt change of phase coordinates The relation between these two approaches is also discussed and several applications both traditional and emerging are considered This text is intended for graduate students and researchers in control engineering and optimal control theory for dynamical systems Readers are assumed to be familiar with the theory of ODEs optimal control and functional analysis though an appendix is included that covers many of the necessary mathematical concepts
