

# STEREOTACTIC RADIOTHERAPY OF RECURRENT MALIGNANT GLIOMAS

Clinical White Paper

Tumors of the central nervous system (CNS) represent approximately 1,750,000 newly diagnosed cases worldwide per year, with an estimated annual mortality of 125,000.<sup>1,2</sup> Malignant gliomas comprise 30% of all primary CNS tumors and remain one of the greatest challenges in oncology today, despite access to state-of-the-art surgery, imaging, radiotherapy and chemotherapy<sup>3</sup>.

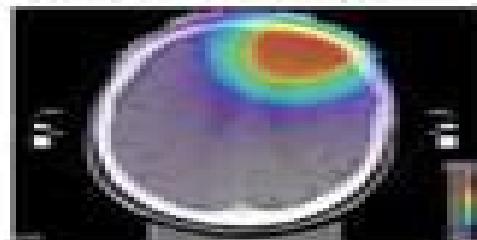

Figure: Details of a typical recurrent glioma treatment plan.

Since initial symptoms of malignant glioma depend on the location, size and growth of the tumor and may include headache, seizures, focal neurological deficits and changes in mental status<sup>4</sup>, both the tumor and its extensions often result in profound quality of life changes. Early failure of local treatment in association with these changes and relapse occurs as soon as additional growth arises at the margin of the original lesion in approximately 60% of all cases<sup>5</sup>.

The WHO tumor classification system is predominantly used for defining and grading malignant glioma, with the system grade II (mild-moderate) and grade III (moderate-malignant) (G3MM) and the most prevalent type with "gross progression". For reoperations, median survival time is limited to approximately 10–15 months.

Although malignant gliomas are insurmountable in the vast majority of patients, surgery and radiotherapy are the mainstays of treatment of local therapy protocols and provide definitive survival benefit<sup>6,7</sup>. Surgical techniques remain an important tool for glioma management, with complete surgical resection as the goal.

Regardless of the degree of resection, adjuvant radiotherapy is administered after surgery. In early randomized studies, significant increases in survival were achieved in patients with high-grade glioma with the administration of 300–400 Gy of whole brain radiotherapy following surgery<sup>8</sup>. Adjuvant chemotherapy is also used in the initial treatment of high-grade glioma, with increased survival recently demonstrated in clinical trials<sup>9</sup>.

The vast majority of glioma recur within or adjacent to the original tumor bed. Treatment options for recurrent glioma are limited because most therapeutic interventions have already been performed, including neurosurgery and a full course of radiotherapy and chemotherapy. Optimal surgical resection might be possible in a subgroup of patients; however, it is accompanied by an high risk of uncertainty because of the infiltrative nature of the tumor<sup>10</sup>. Conventional radiotherapy alternatives are often limited with respect to dose gradients. Intensity-modulated radiotherapy is currently a component of first-line therapy in most patients.

Stereotactic radiosurgery (SRS) is representing the basis of the ability to precisely deliver high doses of radiation to a defined target volume in a single fraction with low treatment-related morbidity compared with surgery<sup>11</sup>. However, SRS is limited to smaller lesions and low doses, as the risk of radiation-induced side effects rises with increasing treatment volume and dose<sup>12</sup>. Fractionated stereotactic radiotherapy (FSRT) extends the previous application of radiotherapy to a defined target volume while exploiting the radiobiological advantage of fractionation and minimizing the risk for normal-tissue-induced side effects.

Combining SRT with chemotherapy further increases high-grade recurrent glioma treatment efficiency. For example, temozolamide has been shown to improve quality-of-life and overall survival<sup>13</sup>.

An overview of the recent literature on hypofractionated SRT treatments for recurrent malignant glioma is presented in the following section.

## **Radiotherapy Of Malignant Disease:**

**The Radiotherapy of Malignant Disease** R.C.S. Pointon, 2012-12-06 Radiotherapy as practiced at the renowned Christie Hospital and Holt Radium Institute is brought up to date in this new second edition of The Radiotherapy of Malignant Disease. The contributions are all written by current or former members of the hospital staff. The opening chapters provide the necessary background information basic physics and radiobiology principles of chemotherapy and mould room practice. The main part of the book represents the very essence of the Manchester school of thought. It is designed to show in detail how to treat by X rays and radium malignant tumors in various anatomical sites. The book thus gives practical guidance on clinical techniques necessary in all disciplines involved in the management of malignant disease. From the reviews of the first edition It should be in the library of every radiotherapy department and in the hands of every trainee British Medical Journal 1 This book should be an important and interesting reference book on the shelves of any medical library or radiotherapist's office American Journal of Roentgenology 2 There can be few established radiotherapists described by the editors as the epitome of the oncologist who did not read the earlier versions of the Manchester textbook and may still use it for reference. This latest edition is costly but it should continue to be read by all trainees aspiring to the DMRT and FRCR wherever they may be in training and whatever the philosophy of their teachers Journal of the Royal Society of Medicine 3

**The Radiotherapy of Malignant Disease** E.C. Easson, R.C.S. Pointon, 2012-12-06 Radiotherapy or radiation therapeutics as the name suggests is a branch of general therapeutics. In this case the therapeutic agent is ionising radiation which induces specific and predictable biological changes. Radiotherapy is sometimes described as therapeutic radiology because historically the earliest X ray machines were used both for diagnostic and therapeutic purposes. Diagnostic radiology has since become a very complex and time consuming speciality requiring the undivided care and attention of the diagnostic radiologist. Similarly radiotherapy now embraces both X ray beams and the radiations from radium and various artificial radium substitutes. This too requires the full time attention of the radiotherapist. In recent years radiotherapy has sometimes been described as radiotherapeutic oncology to indicate the involvement of the radiotherapist in oncological management and indeed in all aspects of oncology from prevention and early detection to the treatment after care and for those who need it terminal care of the patient. The radiotherapist by total commitment to the cancer problem is in truth the epitome of the oncologist. In the same way as the medical physician or internist requires a proper understanding of the pharmacology of the therapeutic agents he or she employs the nature metabolic biochemistry and biological effects of any administered drug so also the radiotherapist needs to understand the nature biological effects and therapeutic potentialities of ionising radiations. The radiotherapist's pharmacology involves an understanding of the relevant physics and radiobiology

Brady,2009-04-15 Non malignant or benign diseases can be successfully treated using ionizing radiation technologies It was first proposed in 1898 by Sokoloff who reported the analgesic effects of radiotherapy for painful rheumatoid arthritis Since then the use of these techniques for painful muscle skeletal diseases has gained acceptance particularly in Europe but is still carried out actively in the United States Non malignant diseases that are amenable to radiotherapy can be classified as inflammatory degenerative hyper proliferative functional or other disorders However the topographic and morphologic considerations are more relevant Even though radiation therapy for benign diseases has not been pursued actively since the 1950s more recent interest has dictated that it can be a very effective treatment modality The use of radiotherapy can be justified for invasive and aggressive growth such as that seen with desmoids for cosmetic deformations and functional loss as seen with keloids or endocrine orbitopathy or for life threatening complications such as hepatic hemangiomas or juvenile angiomyomas that occur in children or adolescents Many of the non malignant diseases can have a major and lasting effect on quality of life by causing pain or other serious symptoms particularly when other methods of treatment are unavailable have failed or may induce more side effects It is not generally the first choice of therapy in these non malignant diseases but it is acceptable as defined The book edited by Seegenschmiedt et al      Subject Index of Current Extramural Research Administered by the National Cancer Institute National Cancer Institute (U.S.),1974      Research Awards Index ,1977
