The Semantics of Relationships R. Green, C.A. Bean, Sung Hyon Myaeng, 2013-04-18 The genesis of this volume was the participation of the editors in an ACMISIGIR Association for Computing Machinery Special Interest Group on Information Retrieval workshop entitled *Beyond Word Relations* Hetzler 1997 This workshop examined a number of relationship types with significance for information retrieval beyond the conventional topic matching relationship From this shared participation came the idea for an edited volume on relationships with chapters to be solicited from researchers and practitioners throughout the world Ultimately one volume became two volumes The first volume *Relationships in the Organization of Knowledge* Bean Green 2001 examines the role of relationships in knowledge organization theory and practice with emphasis given to thesaural relationships and integration across systems languages cultures and disciplines This second volume examines relationships in a broader array of contexts The two volumes should be seen as companions each informing the other As with the companion volume we are especially grateful to the authors who willingly accepted challenges of space and time to produce chapters that summarize extensive bodies of research The value of the volume clearly resides in the quality of the individual chapters In naming this volume *The Semantics of Relationships An Interdisciplinary Perspective* we wanted to highlight the fact that relationships are not just empty connectives Relationships constitute important conceptual units and make significant contributions to meaning

Geographic Information Science Max J. Egenhofer, Christian Freksa, Harvey J. Miller, 2005-01-11 This section gives a description of notions used throughout this study Current achievements in developing action centered ontologies are also discussed

2 1 Ontologies In the context of information extraction and retrieval different kinds of ontologies can be distinguished

15 Top level ontologies describe very general concepts like space and time not depending on a particular domain Domain ontologies and task ontologies describe the vocabulary related to a generic domain or kind of task detailing the terms used in the top level ontology Application ontologies describe the concepts that depend on the particular domain and task within a specific activity Several investigations have been conducted to bring actions tasks to bear on tologies Among them are Chandrasekaran et al 6 and Mizoguchi et al 23 in the fields of AI and Knowledge Engineering For the geospatial domain Kuhn 21 and Raubal and Kuhn 26 have attempted to support human actions in ontologies for transportation Acknowledging the importance of human actions in the geographic domain a research workshop was held in 2002 bringing together experts from diff ent disciplines to share the knowledge and work on this issue

1 Camara 5 one of the workshop participants has proposed that action driven spatial ontologies are formed via category theory for the case of emergency action plans

Constructing Professional Discourse Concepción Orna-Montesinos, 2012-01-17. This book explores the fascinating role that language plays in the construction of non-verbal objects by mapping out the ontological meaning of the specialised concepts and the domain-specific knowledge embedded in them. In doing so, it provides a comprehensive linguistic insight into the discourse of professional domain-specific communities and hence into the communication practices and procedures of those communities. In this respect, the book offers a response to the claims made by many of the most influential applied linguists today, such as Vijay Bhatia (1993, 2004), John Swales (1990, 2004) or Ken Hyland (2002), among others, who have consistently defended the need for applied linguistic research into the textual, generic and social perspectives on the under-researched interrelatedness of the discursive and professional practices of a discipline. Specifically, this book provides readers with an integrative, multi-perspective approach to the study of professional domain-specific discourses. While it mainly draws on the tenets of genre theory and discourse semantics, it also nurtures from the theoretical and empirical foundations of applied linguistics, cognitive linguistics, corpus linguistics and ontological engineering. The book starts from the analysis of domain-specific texts as final written products with specific lexicogrammatical, semantic and rhetorical features, to later enquire into the written products as textual artefacts closely linked to the social context of production and interpretation of the text. This integrative approach provides fresh new insights into the way the processes of writing are affected by the community-specific institutional and socio-historical circumstances in which domain-specific texts are produced.

Semantic Relations Between Nominals Vivi Nastase, Stan Szpakowicz, Preslav Nakov, Diarmuid Ó Séaghdha, 2021-04-08 Opportunity and Curiosity find similar rocks on Mars One can generally understand this statement if one knows that Opportunity and Curiosity are instances of the class of Mars rovers and recognizes that as signalled by the word on ROCKS are located on Mars Two mental operations contribute to understanding recognize how entities concepts mentioned in a text interact and recall already known facts which often themselves consist of relations between entities concepts Concept interactions one identifies in the text can be added to the repository of known facts and aid the processing of future texts The amassed knowledge can assist many advanced language processing tasks including summarization question answering and machine translation Semantic relations are the connections we perceive between things which interact The book explores two now intertwined threads in semantic relations how they are expressed in texts and what role they play in knowledge repositories A historical perspective takes us back more than 2000 years to their beginnings and then to developments much

closer to our time various attempts at producing lists of semantic relations necessary and sufficient to express the interaction between entities concepts A look at relations outside context then in general texts and then in texts in specialized domains has gradually brought new insights and led to essential adjustments in how the relations are seen At the same time datasets which encompass these phenomena have become available They started small then grew somewhat then became truly large The large resources are inevitably noisy because they are constructed automatically The available corpora to be analyzed or used to gather relational evidence have also grown and some systems now operate at the Web scale The learning of semantic relations has proceeded in parallel in adherence to supervised unsupervised or distantly supervised paradigms Detailed analyses of annotated datasets in supervised learning have granted insights useful in developing unsupervised and distantly supervised methods These in turn have contributed to the understanding of what relations are and how to find them and that has led to methods scalable to Web sized textual data The size and redundancy of information in very large corpora which at first seemed problematic have been harnessed to improve the process of relation extraction learning The newest technology deep learning supplies innovative and surprising solutions to a variety of problems in relation learning This book aims to paint a big picture and to offer interesting details
