## **Semi Markov Random Evolutions:**

Semi-Markov Random Evolutions Vladimir S. Korolyuk, Anatoly Swishchuk, 2012-12-06 The evolution of systems in random media is a broad and fruitful field for the applications of different mathematical methods and theories This evolution can be characterized by a semigroup property In the abstract form this property is given by a semigroup of operators in a normed vector Banach space In the practically boundless variety of mathematical models of the evolutionary systems we have chosen the semi Markov random evolutions as an object of our consideration The definition of the evolutions of this type is based on rather simple initial assumptions The random medium is described by the Markov renewal processes or by the semi Markov processes The local characteristics of the system depend on the state of the random medium At the same time the evolution of the system does not affect the medium Hence the semi Markov random evolutions are described by two processes namely by the switching Markov renewal process which describes the changes of the state of the external random medium and by the switched process i e by the semigroup of operators describing the evolution of the system in the semi Markov random medium

**Discrete-Time Semi-Markov Random Evolutions and Their Applications** Nikolaos Limnios, Anatoliy Swishchuk, 2023-07-24 This book extends the theory and applications of random evolutions to semi Markov random media in discrete time essentially focusing on semi Markov chains as switching or driving processes After giving the definitions of discrete time semi Markov chains and random evolutions it presents the asymptotic theory in a functional setting including weak convergence results in the series scheme and their extensions in some additional directions including reduced random media controlled processes and optimal stopping Finally applications of discrete time semi Markov random evolutions in epidemiology and financial mathematics are discussed This book will be of interest to researchers and graduate students in applied mathematics and statistics and other disciplines including engineering epidemiology finance and economics who are concerned with stochastic models of systems

**Discrete-Time Semi-Markov Random Evolutions and Their Applications** Nikolaos Limnios, Anatoliy Swishchuk, 2023 This book extends the theory and applications of random evolutions to semi Markov random media in discrete time essentially focusing on semi Markov chains as switching or driving processes After giving the definitions of discrete time semi Markov chains and random evolutions it presents the asymptotic theory in a functional setting including weak convergence results in the series scheme and their extensions in some additional directions including reduced random media controlled processes and optimal stopping Finally applications of discrete time semi Markov random evolutions in epidemiology and financial mathematics are discussed This book will be of interest to researchers and graduate students in applied mathematics and statistics and other disciplines including engineering epidemiology finance and economics who are concerned with stochastic models of systems

**Evolution of Systems in Random Media** Vladimir S. Korolyuk, Anatoly V. Swishchuk, 1995-09-11 Evolution of Systems in Random Media is an innovative application oriented text that explores stochastic models of evolutionary stochastic systems in random media

Specially designed for researchers and practitioners who do not have a background in random evolutions the book allows non experts to explore the potential information and applications that random evolutions can provide Random Evolutions and their Applications Anatoly Swishchuk,2013-03-14 The book is devoted to the new trends in random evolutions and their various applications to stochastic evolutionary systems SES Such new developments as the analogue of Dynkin's formulae boundary value problems stochastic stability and optimal control of random evolutions stochastic evolutionary equations driven by martingale measures are considered The book also contains such new trends in applied probability as stochastic models of financial and insurance mathematics in an incomplete market In the famous classical financial mathematics Black Scholes model of a B S market for securities prices which is used for the description of the evolution of bonds and stocks prices and also for their derivatives such as options futures forward contracts etc it is supposed that the dynamic of bonds and stocks prices are set by a linear differential and linear stochastic differential equations respectively with interest rate appreciation rate and volatility such that they are predictable processes Also in the Arrow Debreu economy the securities prices which support a Radner dynamic equilibrium are a combination of an Ito process and a random point process with the all coefficients and jumps being predictable processes Random Evolutions and Their Applications Anatoly

Swishchuk,2012-12-06 The main purpose of this handbook is to summarize and to put in order the ideas methods results and literature on the theory of random evolutions and their applications to the evolutionary stochastic systems in random media and also to present some new trends in the theory of random evolutions and their applications In physical language a random evolution RE is a model for a dynamical system whose state of evolution is subject to random variations Such systems arise in all branches of science For example random Hamiltonian and Schrodinger equations with random potential in quantum mechanics Maxwell's equation with a random refractive index in electrodynamics transport equations associated with the trajectory of a particle whose speed and direction change at random etc There are the examples of a single abstract situation in which an evolving system changes its mode of evolution or law of motion because of random changes of the environment or in a medium So in mathematical language a RE is a solution of stochastic operator integral equations in a Banach space The operator coefficients of such equations depend on random parameters Of course in such generality our equation includes any homogeneous linear evolving system Particular examples of such equations were studied in physical applications many years ago A general mathematical theory of such equations has been developed since 1969 the Theory of Random Evolutions

### **Random Motions in Markov and Semi-Markov Random Environments 2** Anatoliy Pogorui,Anatoliy

Swishchuk,Ramon M. Rodriguez-Dagnino,2021-01-11 This book is the second of two volumes on random motions in Markov and semi Markov random environments This second volume focuses on high dimensional random motions This volume consists of two parts The first expands many of the results found in Volume 1 to higher dimensions It presents new results on the random motion of the realistic three dimensional case which has so far been barely mentioned in the literature and deals

with the interaction of particles in Markov and semi Markov media which has in contrast been a topic of intense study The second part contains applications of Markov and semi Markov motions in mathematical finance It includes applications of telegraph processes in modeling stock price dynamics and investigates the pricing of variance volatility covariance and correlation swaps with Markov volatility and the same pricing swaps with semi Markov volatilities

**Inhomogeneous Random Evolutions and Their Applications** Anatoliy Swishchuk,2019-12-11 Inhomogeneous Random Evolutions and Their Applications explains how to model various dynamical systems in finance and insurance with non homogeneous in time characteristics It includes modeling for financial underlying and derivatives via Levy processes with time dependent characteristics limit order books in the algorithmic and HFT with counting price changes processes having time dependent intensities risk processes which count number of claims with time dependent conditional intensities multi asset price impact from distressed selling regime switching Levy driven diffusion based price dynamics Initial models for those systems are very complicated which is why the author s approach helps to simplified their study The book uses a very general approach for modeling of those systems via abstract inhomogeneous random evolutions in Banach spaces To simplify their investigation it applies the first averaging principle long run stability property or law of large numbers LLN to get deterministic function on the long run To eliminate the rate of convergence in the LLN it uses secondly the functional central limit theorem FCLT such that the associated cumulative process centered around that deterministic function and suitably scaled in time may be approximated by an orthogonal martingale measure in general and by standard Brownian motion in particular if the scale parameter increases Thus this approach allows the author to easily link for example microscopic activities with macroscopic ones in HFT connecting the parameters driving the HFT with the daily volatilities This method also helps to easily calculate ruin and ultimate ruin probabilities for the risk process All results in the book are new and original and can be easily implemented in practice

**Random Motions in Markov and Semi-Markov Random Environments 1** Anatoliy Pogorui,Anatoliy Swishchuk,Ramon M. Rodriguez-Dagnino,2021-01-12 This book is the first of two volumes on random motions in Markov and semi Markov random environments This first volume focuses on homogenous random motions This volume consists of two parts the first describing the basic concepts and methods that have been developed for random evolutions These methods are the foundational tools used in both volumes and this description includes many results in potential operators Some techniques to find closed form expressions in relevant applications are also presented The second part deals with asymptotic results and presents a variety of applications including random motion with different types of boundaries the reliability of storage systems and solutions of partial differential equations with constant coefficients using commutative algebra techniques It also presents an alternative formulation to the Black Scholes formula in finance fading evolutions and telegraph processes including jump telegraph processes and the estimation of the number of level crossings for telegraph processes
