Numerical Simulation of Mechatronic Sensors and Actuators

Manfred Kaltenbacher, 2014-03-12 The focus of this book is concerned with the modeling and precise numerical simulation of mechatronic sensors and actuators These sensors actuators and sensor actuator systems are based on the mutual interaction of the mechanical field with a magnetic an electrostatic or an electromagnetic field In many cases the transducer is immersed in an acoustic fluid and the solid fluid coupling has to be taken into account Examples are piezoelectric stack actuators for common rail injection systems micromachined electrostatic gyro sensors used in stabilizing systems of automobiles or ultrasonic imaging systems for medical diagnostics The modeling of mechatronic sensors and actuators leads to so called multifield problems which are described by a system of nonlinear partial differential equations Such systems can not be solved analytically and thus a numerical calculation scheme has to be applied The schemes discussed in this book are based on the finite element FE method which is capable of efficiently solving the partial differential equations The complexity of the simulation of multifield problems consists in the simultaneous computation of the involved single fields as well as in the coupling terms which introduce additional nonlinearities Examples are moving conductive electrically charged body within a magnetic an electric field electromagnetic and or electrostatic forces
