in Atomic Spectroscopy Jose Andrade-Garda, 2015-11-09 The first edition of this book was a first book for atomic spectroscopists to present the basic principles of experimental designs optimization and multivariate regression Multivariate regression is a valuable statistical method for handling complex problems such as spectral and chemical interferences which arise during atomic spectrometry However the technique is underused as most spectroscopists do not have time to study the often complex literature on the subject This practical introduction uses conceptual explanations and worked examples to give readers a clear understanding of the technique Mathematics is kept to a minimum but when required is kept at a basic level Practical considerations interpretations and troubleshooting are emphasized and literature surveys are included to guide the reader to further work The same dataset is used for all chapters dealing with calibration to demonstrate the differences between the different methodologies Readers will learn how to handle spectral and chemical interferences in atomic spectrometry in a new more efficient and cost effective way

Energy's DOE's site characterization and monitoring programs concentrates on the potential use of chemometrics techniques in analysis of sensor data. Chemometrics is the chemical discipline that uses mathematical statistical and other methods that employ formal logic to design or select optimal measurement procedures and experiments and provide maximum relevant chemical information by analyzing chemical data. The report emphasizes the latter aspect. In a formal sense two distinct phases are in chemometrics applications to analytical chemistry problems: 1 the exploratory data analysis phase and 2 the calibration and prediction phase. For use in real world problems it is wise to add a third aspect the independent validation and verification phase. In practical applications such as the ERWM work and in order of decreasing difficulties the most difficult tasks in chemometrics are establishing the necessary infrastructure to manage sampling records data handling and data storage and related aspects exploring data analysis and solving calibration problems especially for nonlinear models. Chemometrics techniques are different for what are called zeroth first and second order systems and the details depend on the form of the assumed functional relationship between the measured response and the concentrations of components in mixtures. In general linear relationships can be handled relatively easily but nonlinear relationships can be difficult.
