Catalysis by Transition Metal Sulphides
RAYBAUD Pascal, TOULHOAT Hervé, 2013-03-01 The main application of Transition Metal Sulphides TMS as solid catalysts is for production of clean fuels in petroleum refineries The various feedstocks to be processed all contain more or less sulphur included in highly stable heteroaromatic molecules In order to meet the stringent specifications imposed worldwide nowadays on transportation fuels to reduce their environmental impact catalytic hydroprocessing remains essential In this process sulphur is removed as H₂S following the reaction between molecular hydrogen and the heteroaromatics The reaction conditions and reaction medium composition are such that only TMS provide stable catalysts generally supported on alumina Both for their fundamental and applied interest these fascinating systems are still the subject of a very significant research effort while major advances have been made over the past 30 years involving innovative preparation routes sophisticated surface science experiments for characterisation detailed kinetic and mechanistic studies and state of the art DFT simulations giving unprecedented insight into the local structure as well as elementary steps at microscopic level This book aims at providing a complete comprehensive and updated survey of the field useful for anyone involved the student starting a research project the academic researcher or the refinery engineer willing to deepen their knowledge on the catalytic as well as on the process aspects 37 specialists from IFP Energies nouvelles CNRS or French universities have contributed reporting a unique synthesis of the last 15 years of research The preface written by Mich le Breysse a well known leading scientist who devoted most of her fruitful career to this topic puts this collective work into a meaningful historical perspective Contents

Separations of f Elements Gregory R. Choppin, K.L. Nash, 2013-06-29 The symposium which provided the incentive for this volume was conducted in San th Diego California as a part of the 207 National Meeting of the American Chemical Society March 13 17 1994 It was conceived partly

to continue an informal decennial sequence of symposia dedicated to the topic of element separations. A lot has changed in the world of elements over the last ten years precipitating a change in emphasis which should be evident to most practitioners in the field. Production and reprocessing of nuclear fuels are no longer the principal drivers of element separation technology. Separations technology for environment restoration waste disposal and the preparation of high purity lanthanides are now the defining parameters in this important field. These imperatives are reflected in the contributions to this volume. The symposium itself must be considered a success as the attendance at all sessions was above expectations despite the fact that it was conducted on the last two days of a large five day meeting. Our thanks to the speakers for their quality presentations and to the audience who persevered to the end of a long meeting and against the temptation of the excellent weather of San Diego in the springtime. A complete list of symposium participants is given in Appendix 1.

Preparation of this volume has been a relatively painless undertaking largely as a result of the high quality of the submitted papers.
