Septic Shock:

Septic Shock Methods and Protocols Thomas J. Evans, 2008-02-01 Septic shock remains a serious medical condition with high mortality. Despite many advances in intensive care medicine and antibiotic development, this has not changed appreciably in the last 20 years. Frustratingly, over the same period of time, enormous advances have been made in understanding the underlying pathogenic mechanisms of this condition. This has resulted in the development of several novel therapies for septic shock which, despite excellent theoretical grounds for their efficacy, have failed in altering mortality attributable to sepsis. The reasons for these failures are multiple, but it is clear that further research is required aimed at increasing our understanding of the basic pathophysiological processes that occur following infection. Research into septic shock draws upon a number of different disciplines ranging from molecular and cellular biology to physiological measurements on whole animals. *Septic Shock Methods and Protocols* is an attempt to draw together into one volume a number of protocols that are of use in the investigation of the mechanisms of septic shock. I have divided the book into five sections. The first deals with endotoxin, the lipopolysaccharide component of the Gram-negative cell membrane that can mimic many of the features of septic shock. Gram-positive organisms are found increasingly as causes of septic shock, and several products of toxins produced from these bacteria are considered in the second section.

Septic Shock J. L. Vincent, Lambertus G. Thijs, 1987 The European Society of Intensive Care and the European Shock Society selected a group of expert scientists and clinicians in the field of septic shock to define the acquired knowledge, the present controversies, and the priorities for future research. This conference was held in Brussels on March 12, 1987. The reports of the discussion have been collected in this state-of-the-art update on septic shock.

Sepsis and Septic Shock: An Issue of Critical Care Clinics Claudia Lance, 2021-11-16 Shock is caused by the decreased flow of blood to the body tissues due to circulatory system-related problems. Sepsis refers to a life-threatening condition where the body causes injury to its own organs and tissues in response to an infection. When sepsis lowers the blood pressure to the extent where it does not improve after fluid replacement, it is known as septic shock. Sepsis happens due to an inflammatory immune response which is triggered by an infection. Septic shock is usually caused by bacteria, but it can also be caused by fungi, parasites, or viruses. It generally affects the lungs, urinary tract, brain, or skin. Fever, increased breathing, and heart rate, and confusion are some of its common signs and symptoms. Severe sepsis results in organ dysfunction and poor blood flow. This book provides significant information to help develop a good understanding of sepsis and septic shock. Different approaches, evaluations, methodologies, and advanced studies have been included herein. Those in search of information to further their knowledge will be greatly assisted by this book.

Pathology of Septic Shock Ernst T. Rietschel, Hermann Wagner, 2012-12-06 Severe sepsis and septic shock are the most serious complications of bacterial infections. Both gram-positive and gram-negative bacteria can trigger these extreme inflammatory responses, and by so doing, cause substantial morbidity and mortality. In the United States alone, over 400,000 patients suffer from septicemia each year.

and approximately 100 000 of these patients die despite optimal intensive care and modern antimicrobial therapy. These dramatic figures have prompted intensive research to define the bacterial and host factors involved in the septic response. Scientists from many disciplines including chemistry, physics, biology, medical microbiology, immunology and pharmacology have worked closely with clinicians to achieve rapid and profound progress. To translate this newly acquired knowledge into clinical practice, clinical trials have also been performed to evaluate numerous new therapeutic drugs. The disappointing results from these trials have underscored a major lesson, namely that sepsis constitutes an extremely complex syndrome and that basic and clinical research must be greatly intensified in order to illuminate its molecular mechanisms. At this stage, the editors of the present volume of *Current Topics in Microbiology and Immunology* considered it would be rewarding to compile a volume summarizing our present basic and clinical knowledge on sepsis. Our particular gratitude extends to those international experts who have followed our invitation and elaborated on particular areas of the basic and clinical aspects of this field.

Septic Shock George H. Sakorafas, Adelais G. Tsiotou, 2005 Sepsis is one of the most frequent complications in the surgical patient and one of the leading causes of mortality in intensive care units. During the past two decades, a great deal has been learned about surgical bacteriology, antibiotic prophylaxis, supportive management and the host response to microbial invasion. Sepsis can be caused by infection with gram-negative bacteria, gram-positive bacteria, fungi and particularly *Candida* or viruses. Sepsis may also occur in the absence of detectable bacterial invasion and in these cases, microbial toxins, particularly gram-negative bacterial endotoxin, lipopolysaccharide (LPS) and endogenous cytokine production have been implicated as initiators and mediators. Although activation of the immune system during microbial invasion is generally protective, septic shock develops in a significant number of patients as a consequence of a poorly regulated immune response to the offending organism. Sepsis can be presented with a spectrum of severity. Septic shock represents the most severe form of host response to infection. The aim of this monograph is to summarise the currently available data regarding epidemiology, pathogenesis and optimal management of septic shock, with a particular emphasis on the role of source control in sepsis. Emerging therapies for septic shock are also discussed.

Septic Shock Melvin C. Johnston, Jerome E. Knight, 2013-07 Septic shock is a common and lethal condition that remains one of the leading causes of death in the hospital. Greater awareness, understanding of the condition and knowledge of effective management may decrease the mortality rate. In this book, the authors discuss the symptoms, management and risk factors of septic shock. Topics include the pathophysiology of cardiovascular failure in septic shock, life-threatening infections and septic shock during idiopathic drug-induced agranulocytosis, the role of HMGB1 in cardiac dysfunction during septic shock, the epidemiological impact of sepsis and septic shock and possible implications for the treatment of septic patients with interventions aimed at opening microcirculation.
