are among the most extensive freshwater aquatic ecosystems in the world Their evolution results from the interactions of numerous natural and anthropogenic factors This book includes 12 chapters and presents case studies on the impacts of changes and tectonic movements on the evolution of lake water levels Section 1 the interactions between anthropogenic activities and the physicochemical characteristics of lakes Section 2 and the limnological characteristics and their interactions with other components of the environment Section 3 **Ecological Restoration of Aquatic and**

Semi-Aquatic Ecosystems in the Netherlands (NW Europe) P.H. Nienhuis, Ramesh D. Gulati, 2013-03-14 This work presents the state of the art of aquatic and semi aquatic ecological restoration projects in The Netherlands Starting from the conceptual basis of restoration ecology the successes and failures of hundreds of restoration projects are described

Numerous successful projects are mentioned. In general ecological restoration endeavours greatly benefit from the progressive experience achieved in the course of the years. Failures mainly occur through insufficient application of physical, chemical or ecological principles. Spontaneous colonization by plants and animals following habitat reconstruction is preferred. However, sometimes the re-introduction of keystone species e.g. eelgrass, salmon, beaver is necessary in case the potential habitats are isolated or fragmented or if a seed bank is lacking, thus not allowing viable populations to develop. Re-introducing traditional management techniques e.g. mowing without fertilization, low intensity grazing is important to rehabilitate the semi-natural and cultural landscapes that are so characteristic for The Netherlands.

Inland aquatic habitats occur world wide at all scales from marshes, swamps and temporary puddles to ponds, lakes and inland seas from streams and creeks to rolling rivers. Vital for biological diversity, ecosystem function and as resources for human life, commerce and leisure, inland waters are a vital component of life on Earth. The *Encyclopedia of Inland Waters* describes and explains all the basic features of the subject from water chemistry and physics to the biology of aquatic creatures and the complex function and balance of aquatic ecosystems of varying size and complexity. Used and abused as an essential resource, it is vital that we understand and manage them as much as we appreciate and enjoy them. This extraordinary reference brings together the very best research to provide the basic and advanced information necessary for scientists to understand these ecosystems and for water resource managers and consultants to manage and protect them for future generations. Encyclopedic reference to Limnology, a key core subject in ecology, taught as a specialist course in universities. Over 240 topic related articles cover the field. Gene Likens is a renowned limnologist and conservationist, Emeritus Director of the Institute of Ecosystems Research, elected member of the American Philosophical Society and recipient of the 2001 National Medal of Science. Subject Section Editors and authors include the very best research workers in the field.
