**Statistical Models of Shape** Rhodri Davies, Carole Twining, Chris Taylor, 2008-12-15 The goal of image interpretation is to convert raw image data into meaningful information Images are often interpreted manually In medicine for example a radiologist looks at a medical image interprets it and translates the data into a clinically useful form Manual image interpretation is however a time consuming error prone and subjective process that often requires specialist knowledge Automated methods that promise fast and objective image interpretation have therefore stirred up much interest and have become a significant area of research activity Early work on automated interpretation used low level operations such as edge detection and region growing to label objects in images These can produce reasonable results on simple images but the presence of noise occlusion and structural complexity often leads to erroneous labelling Furthermore labelling an object is often only the first step of the interpretation process In order to perform higher level analysis a priori information must be incorporated into the interpretation process A convenient way of achieving this is to use an explicit model to encode information such as the expected size shape appearance and position of objects in an image The use of explicit models was popularized by the active contour model or snake [98] A snake deforms so as to match image evidence e.g. edges whilst ensuring that it satisfies structural constraints However a snake lacks specificity as it has little knowledge of the domain limiting its value in image interpretation

Information Processing in Medical Imaging Chris Taylor, J. Alison Noble, 2003-09-09 IPMI occupies an important position in the scientific calendar Every two years it brings together leading researchers in medical image formation analysis and interpretation for an international workshop that allows extensive in depth discussion of new ideas Many of the most influential developments in the field were first presented at IPMI and the series has done much to foster a rigorous scientific approach to information processing in medical imaging IPMI 2003 was held over 5 days in July 2003 at St Martin's College beside in the heart of the English Lake District Full papers were invited on any aspect of information processing in medical imaging with particular encouragement for submissions exploring generic mathematical or computational principles Recognizing the rapidly evolving nature of the field we encouraged a broad interpretation of medical imaging from macroscopic to molecular imaging from applications in patient care to those in biomedical research We received 123 submissions by the deadline in February 2003 Each paper was reviewed by four members of the Scientific Committee placing particular emphasis on originality scientific rigor and biomedical relevance Papers were selected for the meeting by a Paper Selection Committee based on reviewers rankings and

their detailed comments. A total of 28 papers were accepted as oral presentations and 29 as posters. Unfortunately, the standard was so high that we had to turn down many excellent papers.

Yen-Wei Chen, Lakhmi C. Jain, 2014-04-07. This research book provides a comprehensive overview of the state of the art subspace learning methods for pattern recognition in intelligent environment. With the fast development of internet and computer technologies, the amount of available data is rapidly increasing in our daily life. How to extract core information or useful features is an important issue. Subspace methods are widely used for dimension reduction and feature extraction in pattern recognition. They transform a high dimensional data to a lower dimensional space, subspace, where most information is retained. The book covers a broad spectrum of subspace methods, including linear, nonlinear, and multilinear subspace learning methods and applications. The applications include face alignment, face recognition, medical image analysis, remote sensing, image classification, traffic sign recognition, image clustering, super resolution, edge detection, multi-view facial image synthesis.
