Hanle, 2013-11-11 H J BEYER AND H KLEINPOPPEN During the preparation of Parts A and B of Progress in Atomic Spectroscopy a few years ago it soon became obvious that a comprehensive review and description of this field of modern atomic physics could not be achieved within the limitations of a two volume book While it was possible to include a large variety of spectroscopic methods inevitably some fields had to be cut short or left out altogether Other fields have developed so rapidly that they demand full cover in an additional volume One of the major problems already encountered during the preparation of the first volumes was to keep track of new developments and approaches which result in spectroscopic data We have to look far beyond the area of traditional atomic spectroscopy since methods of atomic and ion collision physics nuclear physics and even particle physics all make important contributions to our knowledge of the static and dynamical state of atoms and ions and thereby greatly add to the continuing fascination of a field of research which has given us so much fundamental knowledge since the middle of the last century In this volume we have tried to strike a balance between contributions belonging to the more established fields of atomic structure and spectroscopy and those fields where atomic spectroscopy overlaps with other areas

*The Chemical Bond I* D. Michael P. Mingos, 2016-09-09 The series Structure and Bonding publishes critical reviews on topics of research concerned with chemical structure and bonding The scope of the series spans the entire Periodic Table and addresses structure and bonding issues associated with all of the elements It also focuses attention on new and developing areas of modern structural and theoretical chemistry such as nanostructures molecular electronics designed molecular solids surfaces metal clusters and supramolecular structures Physical and spectroscopic techniques used to determine examine and model structures fall within the purview of Structure and Bonding to the extent that the focus is on the scientific results obtained and not on specialist information concerning the

techniques themselves Issues associated with the development of bonding models and generalizations that illuminate the reactivity pathways and rates of chemical processes are also relevant The individual volumes in the series are thematic The goal of each volume is to give the reader whether at a university or in industry a comprehensive overview of an area where new insights are emerging that are of interest to a larger scientific audience Thus each review within the volume critically surveys one aspect of that topic and places it within the context of the volume as a whole The most significant developments of the last 5 to 10 years should be presented using selected examples to illustrate the principles discussed A description of the physical basis of the experimental techniques that have been used to provide the primary data may also be appropriate if it has not been covered in detail elsewhere The coverage need not be exhaustive in data but should rather be conceptual concentrating on the new principles being developed that will allow the reader who is not a specialist in the area covered to understand the data presented Discussion of possible future research directions in the area is welcomed Review articles for the individual volumes are invited by the volume editors *Ion-solid Interactions: Bibliography* Walter M.
