Computer Science Logo Style: Symbolic computing Brian Harvey,1997 This series is for people adults and teenagers who are interested in computer programming because it s fun The three volumes use the Logo programming language as the vehicle for an exploration of computer science from the perspective of symbolic computation and artificial intelligence Logo is a dialect of Lisp a language used in the most advanced research projects in computer science especially in artificial intelligence Throughout the series functional programming techniques including higher order functions and recursion are emphasized but traditional sequential programming is also used when appropriate In the second edition the first two volumes have been rearranged so that illustrative case studies appear with the techniques they demonstrate Volume 1 includes a new chapter about higher order functions and the recursion chapters have been reorganized for greater clarity Volume 2 includes a new tutorial chapter about macros an exclusive capability of Berkeley Logo and two new projects Throughout the series the larger program examples have been rewritten for greater readability by more extensive use of data abstraction Volume 1 Symbolic Computing is addressed to a reader who has used computers and wants to learn the ideas behind them Symbolic computing is the manipulation of words and sentences in contrast both to the graphics most people associate with Logo and to the numerical computation with which more traditional languages such as Pascal and C are most comfortable This volume is well known for its clear and thorough presentation of recursion a key idea in computer science that other texts treat as arcane and difficult The Logo programs in these books and the author s free Berkeley Logo interpreter are available via the

Internet or on diskette *Guide to Teaching Computer Science* Orit Hazzan, Noa Ragonis, Tami Lapidot, 2020-08-05 This concise yet thorough textbook presents an active learning model for the teaching of computer science. Offering both a conceptual framework and detailed implementation guidelines, the work is designed to support a Methods of Teaching Computer Science (MTCS) course but may be applied to the teaching of any area of computer science at any level, from elementary school to university. This text is not limited to any specific curriculum or programming language but instead suggests various options for lesson and syllabus organization. Fully updated and revised, the third edition features more than 40 new activities, bringing the total to more than 150, together with new chapters on computational thinking, data science, and soft concepts and soft skills. This edition also introduces new conceptual frameworks for teaching, such as the MERge model, and new formats for the professional development of computer science educators. Topics and features include an extensive set of activities to further support the pedagogical principles outlined in each chapter; discusses educational approaches to computational thinking; how to address soft concepts and skills in a MTCS course; and the pedagogy of data science. NEW focuses on teaching methods, lab-based teaching, and research in computer science education, as well as on problem-solving strategies; examines how to recognize and address learners' misconceptions and the different types of questions teachers can use to vary their teaching methods; provides coverage of assessment, teaching planning, and designing a MTCS course; reviews high school teacher preparation programs; and how prospective teachers can gain experience in teaching computer science. This easy-to-follow textbook and teaching guide will prove invaluable to computer science educators within all frameworks, including university instructors and high school teachers, as well as to instructors of computer science teacher preparation programs. **The Cambridge Handbook of Computing Education Research** Sally A. Fincher, Anthony V.

Robins, 2019-02-13 This is an authoritative introduction to Computing Education research, written by over 50 leading researchers from academia and the industry. Collaborative Learning in a Global World Miri Shonfeld, David

Gibson, 2018-11-01 The 21st century has brought about changes in every aspect of life through ubiquitous technology and Internet-based social media. The distances between cultures and continents have narrowed; the world has become flat, and multicultural work teams composed of members from different countries have become a daily reality in global businesses. However, in many ways, these global changes in work practices have only just begun to have an impact on education. To better prepare students for the information age, researchers and policy makers largely agree about the skills needed for shared knowledge construction. Indeed, the education systems in several different countries have begun to integrate these skills into teaching and learning and are placing a strong emphasis on their implementation. Melamed et al 2010, Resta et al 2011. In 2015, the OECD PISA exam for the first time included assessment of collaborative problem solving in its country-by-country comparison. Collaborative learning is not a trivial challenge, nor is it intuitive for all teachers and learners. One must acquire and practice the essential skills in order to successfully work in a team. Consequently, it is essential to train teachers in

collaborative teamwork as they must serve as role models for students In addition new tools and practices become available at a rate that outpaces the abilities of many higher education institutions to adopt and implement This book surveys the current state of the field and provides theoretical guidance and practical examples to help meet the gaps in research development and practice Information Technology Don Passey,Brian Samways,2016-01-09 This book considers how the fundamental issues relating to the use of information technology in education are being tackled across the world Significantly it features international perspectives on the challenge that information and communications technology poses to teacher education views of trainee teacher experiences with computers insights into the ways in which communication technologies are being used to link teachers and students consideration of the impact of change with information and communications technology discussion of the roles of those involved in developing teacher education with information and communications technology at national institutional and teacher levels It contains the selected proceedings of the International Conference on Information technology Supporting change through teacher education sponsored by the International Federation for Information Processing and held at Kiryat Anavim Israel in June July 1996 *The Seasoned Schemer, second edition* Daniel P. Friedman,Matthias Felleisen,1995-12-21 The notion that thinking about computing is one of the most exciting things the human mind can do sets both The Little Schemer formerly known as The Little LISPer and its new companion volume The Seasoned Schemer apart from other books on LISP The authors enthusiasm for their subject is compelling as they present abstract concepts in a humorous and easy to grasp fashion Together these books will open new doors of thought to anyone who wants to find out what computing is really about The Little Schemer introduces computing as an extension of arithmetic and algebra things that everyone studies in grade school and high school It introduces programs as recursive functions and briefly discusses the limits of what computers can do The authors use the programming language Scheme and interesting foods to illustrate these abstract ideas The Seasoned Schemer informs the reader about additional dimensions of computing functions as values change of state and exceptional cases The Little LISPer has been a popular introduction to LISP for many years It had appeared in French and Japanese The Little Schemer and The Seasoned Schemer are worthy successors and will prove equally popular as textbooks for Scheme courses as well as companion texts for any complete introductory course in Computer Science
