Simulating Neural Networks:

Neural Network Simulation Environments Josef Skrzypek, 2012-12-06 Neural Network Simulation Environments describes some of the best examples of neural simulation environments All current neural simulation tools can be classified into four overlapping categories of increasing sophistication in software engineering The least sophisticated are undocumented and dedicated programs developed to solve just one specific problem these tools cannot easily be used by the larger community and have not been included in this volume The next category is a collection of custom made programs some perhaps borrowed from other application domains and organized into libraries sometimes with a rudimentary user interface More recently very sophisticated programs started to appear that integrate advanced graphical user interface and other data analysis tools These are frequently dedicated to just one neural architecture algorithm as for example three layers of interconnected artificial neurons learning to generalize input vectors using a backpropagation algorithm Currently the most sophisticated simulation tools are complete system level environments incorporating the most advanced concepts in software engineering that can support experimentation and model development of a wide range of neural networks These environments include sophisticated graphical user interfaces as well as an array of tools for analysis manipulation and visualization of neural data Neural Network Simulation Environments is an excellent reference for researchers in both academia and industry and can be used as a text for advanced courses on the subject

Neural-Network Simulation of Strongly Correlated Quantum Systems Stefanie Czischek, 2020-08-27 Quantum systems with many degrees of freedom are inherently difficult to describe and simulate quantitatively The space of possible states is in general exponentially large in the number of degrees of freedom such as the number of particles it contains Standard digital high performance computing is generally too weak to capture all the necessary details such that alternative quantum simulation devices have been proposed as a solution Artificial neural networks with their high non local connectivity between the neuron degrees of freedom may soon gain importance in simulating static and dynamical behavior of quantum systems Particularly promising candidates are neuromorphic realizations based on analog electronic circuits which are being developed to capture e g the functioning of biologically relevant networks In turn such neuromorphic systems may be used to measure and control real quantum many body systems online This thesis lays an important foundation for the realization of quantum simulations by means of neuromorphic hardware for using quantum physics as an input to classical neural nets and in turn for using network results to be fed back to quantum systems The necessary foundations on both sides quantum physics and artificial neural networks are described providing a valuable reference for researchers from these different communities who need to understand the foundations of both

Wu,1993-12-14 This work explains network dynamics learning paradigms and computational capabilities of feedforward self organization and feedback neural network models addressing specific problems such as data fusion and data modeling It goes on to describe a neural network simulation software package USTCNET and gives some segments of the program

Multiprocessing Neural Network Simulator Anton Kulakov,2013 Over the last few years tremendous progress has been made in neuroscience by employing simulation tools for investigating neural network behaviour Many simulators have been created during last few decades and their number and set of features continually grows due to persistent interest from groups of researchers and engineers A simulation software that is able to simulate a large scale neural network has been developed and presented in this work Based on a highly abstract integrate and fire neuron model a clock driven sequential simulator has been developed in C The created program is able to associate the input patterns with the output patterns The novel biologically plausible learning mechanism uses Long Term Potentiation and Long Term Depression to change the strength of the connections between the neurons based on a global binary feedback Later the sequentially executed model has been extended to a multi processor system which executes the described learning algorithm using the event driven technique on a parallel distributed framework simulating a neural network asynchronously This allows the simulation to manage larger scale neural networks being immune to processor failure and communication problems The multi processor neural network simulator has been created the main benefit of which is the possibility to simulate large scale neural networks using high parallel distributed computing For that reason the design of the simulator has been implemented considering an efficient weight adjusting algorithm and an efficient way for asynchronous local communication between processors The Neural Simulation Language
