Singularities of Smooth Maps James Eells (jr.), 1967 **Singularities of Differentiable Maps, Volume 1** V.I. Arnold, S.M. Gusein-Zade, Alexander N. Varchenko, 2012-05-24

Singularity theory is a far reaching extension of maxima and minima investigations of differentiable functions with implications for many different areas of mathematics engineering catastrophe theory and the theory of bifurcations and science The three parts of this first volume of a two volume set deal with the stability problem for smooth mappings critical points of smooth functions and caustics and wave front singularities The second volume describes the topological and algebro geometrical aspects of the theory monodromy intersection forms oscillatory integrals asymptotics and mixed Hodge structures of singularities The first volume has been adapted for the needs of non mathematicians presupposing a limited mathematical background and beginning at an elementary level With this foundation the book s sophisticated development permits readers to explore more applications than previous books on singularities

there is nothing so enthralling so grandiose nothing that stuns or captivates the human soul quite so much as a first course in a science After the first five or six lectures one already holds the brightest hopes already sees oneself as a seeker after truth I too have wholeheartedly pursued science passionately as one would a beloved woman I was a slave and sought no other sun in my life Day and night I crammed myself bending my back ruining myself over my books I wept when I beheld others exploiting science for personal gain But I was not long enthralled The truth is every science has a beginning but never an end they go on for ever like periodic fractions Zoology for example has discovered thirty five thousand forms of life A P Chekhov On the road In this book a start is made to the zoology of the singularities of differentiable maps This theory is a young branch of analysis which currently occupies a central place in mathematics it is the crossroads of paths leading from very abstract corners of mathematics such as algebraic and differential geometry and topology Lie groups and algebras complex manifolds commutative algebra and the like to the most applied areas such as differential equations and dynamical systems optimal control the theory of bifurcations and catastrophes short wave and saddle point asymptotics and geometrical and wave optics

Singularities of Smooth Maps Rustam Sadykov, 2005

For a closed oriented 4 manifold M_4 the following conditions are equivalent 1 M_4 admits a fold mapping into R^3 2 for every orientable 3 manifold N^3 every homotopy class of mappings of M_4 into N^3 contains a fold mapping 3 there exists a cohomology class x in $H^2(M_4; \mathbb{Z})$ such that $x \cup x$ is the first Pontrjagin class of M_4 For a simply connected manifold M_4 we show that M_4 admits no fold mappings into N^3 if and only if M_4 is homotopy equivalent to CP^2 or $CP^2 \times CP^2$
