Models Of Disorder:

Models of Disorder John M. Ziman, 1979 *Models of Disorder* J. M. Ziman, 1979-09-06 Originally published in 1979 this book discusses how the physical and chemical properties of disordered systems such as liquids glasses alloys amorphous semiconductors polymer solutions and magnetic materials can be explained by theories based on a variety of mathematical models including random assemblies of hard spheres tetrahedrally bonded networks and lattices of spins The text describes these models and the various mathematical theories by which the observable properties are derived Techniques and concepts such as the mean field and coherent approximations graphical summation percolation scaling and the renormalisation group are explained and applied This book will be of value to anyone with an interest in theoretical and experimental physics

Contemporary Directions in Psychopathology Theodore Millon, Robert F. Krueger, Erik Simonsen, 2011-08-03 This forward thinking volume grapples with critical questions surrounding the mechanisms underlying mental disorders and the systems

used for classifying them Edited and written by leading international authorities many of whom are actively involved with the development of DSM V and ICD 11 the book integrates biological and psychosocial perspectives It provides balanced analyses of such issues as the role of social context and culture in psychopathology and the pros and cons of categorical versus dimensional approaches to diagnosis Cutting edge diagnostic instruments and research methods are reviewed Throughout contributors highlight the implications of current theoretical and empirical advances for understanding real world clinical problems and developing more effective treatments

Equilibrium Statistical Mechanics of Lattice Models
David A. Lavis, 2015-01-31 Most interesting and difficult problems in equilibrium statistical mechanics concern models which exhibit phase transitions For graduate students and more experienced researchers this book provides an invaluable reference source of approximate and exact solutions for a comprehensive range of such models Part I contains background material on classical thermodynamics and statistical mechanics together with a classification and survey of lattice models The geometry of phase transitions is described and scaling theory is used to introduce critical exponents and scaling laws An introduction is given to finite size scaling conformal invariance and Schramm Loewner evolution Part II contains accounts of classical mean field methods The parallels between Landau expansions and catastrophe theory are discussed and Ginzburg Landau theory is introduced The extension of mean field theory to higher orders is explored using the Kikuchi-Hijmans-De Boer hierarchy of approximations In Part III the use of algebraic transformation and decoration methods to obtain exact system information is considered This is followed by an account of the use of transfer matrices for the location of incipient phase transitions in one dimensionally infinite models and for exact solutions for two dimensionally infinite systems The latter is applied to a general analysis of eight vertex models yielding as special cases the two dimensional Ising model and the six vertex model The treatment of exact results ends with a discussion of dimer models In Part IV series methods and real space renormalization group transformations are discussed The use of the De Neef-Enting finite lattice method is described in detail and applied to the derivation of series for a number of model systems in particular for the Potts model The use of Padé differential and algebraic approximants to locate and analyze second and first order transitions is described The realization of the ideas of scaling theory by the renormalization group is presented together with treatments of various approximation schemes including phenomenological renormalization Part V of the book contains a collection of mathematical appendices intended to minimise the need to refer to other mathematical sources

Cross-Linguistic Study of Acquired Reading Disorders Prathibha Karanth, 2012-12-06 The acquisition of reading and the difficulties encountered have been of substantial interest to a wide range of researchers and practitioners for centuries. Given the increasing centrality of literacy in modern life, they are now of even greater interest to an ever widening base of professionals. The study of the acquired reading disorders, though in existence for over a century, received enormous impetus with the publication of a seminal paper by Marshall and Newcombe in 1966, leading to a neuropsychological model of reading. Over the last 30 years, within the single case study design, there has been extensive and exceedingly fine grained research on individuals with acquired disorders of reading in an attempt to establish the validity of these models of reading and the human brain. In addition, these models have had considerable influence on models of the acquisition of reading in children and their concomitant difficulties. Much of this research has been in readers of the alphabetic scripts, particularly the opaque English script. During the last decade or so, there has been increasing evidence, particularly in research on reading acquisition, that what is true of alphabetic scripts like English may not be universally true of all of the scripts of the world. This has led to considerable research into the process of learning to read and write and on the factors affecting reading, which are the touchstone of the models within broader cross linguistic and cross cultural perspectives.
