Oughstun,2019-07-17 In two volumes this book presents a detailed systematic treatment of electromagnetics with application to the propagation of transient electromagnetic fields including ultrawideband signals and ultrashort pulses in dispersive absorptive media This expanded updated and reorganized new edition presents a rigorous development of both time and frequency domain electromagnetics from classical theory to current topics in applied research on temporally pulsed wave fields in dielectric conducting and semiconducting materials With meaningful exercises throughout it is suitable as a graduate textbook in electromagnetic wave theory and will be of use to researchers as a resource on electromagnetic radiation and wave propagation theory with applications to radar imaging communications and safety issues Volume 1 develops the fundamental Maxwell Lorentz theory of microscopic electromagnetics and its relationship to macroscopic electromagnetics in complex media with particularempphasis given to temporally dispersive materials supplemented with several appendices on mathematical methods The second edition includes new material on conjugate electromagnetic fields time reversal invariance the four potential and Lorentz invariance anisotropic and spatially dispersive media double negative metamaterials and generalized Fresnel reflection and refraction coefficients for complex media The relationship between both the mathematical and physical interpretation of classical electromagnetic field theory with the special theory of relativity is emphasized throughout the volume Volume 2 covers temporal pulse dynamics in dispersive attenuative media with asymptotic analysis at the forefront **Performance Analysis of Standard Fourier-Transform Spectrometers.** ,

Hyperspectral Imaging Remote Sensing Dimitris G. Manolakis,Ronald B. Lockwood,Thomas W. Cooley,2016-10-20 A practical and self contained guide to the principles techniques models and tools of imaging spectroscopy Bringing together material from essential physics and digital signal processing it covers key topics such as sensor design and calibration atmospheric inversion and model techniques and processing and exploitation algorithms Readers will learn how to apply the main algorithms to practical problems how to choose the best algorithm for a particular application and how to process and interpret hyperspectral imaging data A wealth of additional materials accompany the book online including example projects and data for students and problem solutions and viewgraphs for instructors This is an essential text for senior undergraduate and graduate students looking to learn the fundamentals of imaging spectroscopy and an invaluable reference for scientists and engineers working in the field **Nuclear Science Abstracts** ,1974 **An Introduction to Materials Science** Wenceslao González-Viñas,Héctor L. understanding of the subject rather than an intensely mathematical one The book covers the topics usually treated in a first course on materials science such as crystalline solids and defects It describes the electrical mechanical and thermal properties of matter the unique properties of dielectric and magnetic materials the phenomenon of superconductivity polymers and optical and amorphous materials More modern subjects such as fullerenes liquid crystals and surface phenomena are also covered and problems are included at the end of each chapter An Introduction to Materials Science is addressed to both undergraduate students with basic skills in chemistry and physics and those who simply want to know more about the topics on which the book focuses
