Handbook of Neurotoxicology Edward J. Massaro, 2001-11-12 Neurotoxicology is a broad and burgeoning field of research Its growth in recent years can be related in part to increased interest in and concern with the fact that a growing number of anthropogenic agents with neurotoxic potential including pesticides lead mercury and the polytypic byproducts of combustion and industrial production continue to be spewed into and accumulate in the environment In addition there is great interest in natural products including toxins as sources of therapeutic agents Indeed it is well known that many natural toxins of broadly differing structure produced or accumulated for predatory or defensive purposes and toxic agents accumulated incidentally by numerous species function to perturb nervous tissue Components of some of these toxins have been shown to be useful therapeutic agents and or research reagents Unfortunately the environmental accumulation of some neurotoxins of anthropogenic origin especially pesticides and metals has resulted in incidents of human poisoning some of epidemic proportion and high levels of morbidity and mortality Furthermore an increasing incidence of neurobehavioral disorders some with baffling symptoms is confronting clinicians It is not clear whether this is merely the result of increased vigilance and or improved diagnostics or a consequence of improved health care In any case the role of exposure to environmental and occupational neurotoxins in the etiology of these phenomena as well as neurodegenerative diseases is coming under increasing scrutiny and investigation

Arthropods as Vectors of Emerging Diseases Heinz Mehlhorn, 2012-07-05 Global warming and globalization are the buzzwords of our time They have nearly reached a religious status and those who deny their existence are considered modern heretics Nevertheless the earth has become an overcrowded village traversable within a single day Thus it is hardly surprising that besides persons and goods also agents of disease are easily transported daily from one end of the world to the other threatening the health and lives of billions of humans and their animals Agents of diseases prions viruses bacteria fungi and parasites are not only transmitted by body contact or direct exchange of bodily fluids but also by means of vectors which belong to the groups of licking or blood sucking arthropods mites ticks insects that live close to humans and their houses Without a doubt the recently accelerating

globalization supports the import of agents of disease into countries where they never had been or where they had long since been eradicated leading to a false sense of living on a safe island These newly imported or reintroduced diseases called emerging diseases may lead to severe outbreaks in cases where the countries are not prepared to combat them or in cases where viruses are introduced that cannot be controlled by medications or vaccines Arthropods are well known vectors for the spread of diseases Thus their invasion from foreign countries and their spreading close to human dwellings must be blocked everywhere in donor and receptor countries using safe and effective measures This book presents reviews on examples of such arthropod borne emerging diseases that lurk on the fringes of our crowded megacities The following topics show that there is an ongoing invasion of potential vectors and that control measures must be used now in order to avoid disastrous outbreaks of mass diseases
