Qualitative Methods In Physical Kinetics And Hydrodynamics:

Qualitative Methods of Physical Kinetics and Hydrodynamics V.P. Krainov, 1992-06-01 Market Graduate students and researchers in physical kinetics hydrodynamics and plasma and solid state physics Vladimir Krainov has produced one of the few books in the field to concentrate on qualitative methods He presents order of magnitude solutions for physical quantities in various nonequilibrium statistical processes as well as qualitative solutions of differential equations for macroscopic nonequilibrium processes in gases and other media Covers topics including free convection turbulence phenomena sound propagation and surface phenomena

Proceedings of the IV Advanced Ceramics and Applications Conference Bill Lee, Rainer Gadow, Vojislav Mitic, 2017-01-16 This is the Proceedings of III Advanced Ceramics and Applications conference held in Belgrade Serbia in 2014 It contains 25 papers on various subjects regarding preparation characterization and application of advanced ceramic materials

Global Energetics of the Atmosphere Boris M. Smirnov, 2022-01-01 This book looks at global atmospheric processes from a physical standpoint using available current and past observational data taken from measurements of relevant atmospheric parameters It describes various aspects of the current atmospheric state and its future evolution focusing primarily on the energetic balance of the Earth and atmosphere and taking into consideration the multi faceted global equilibrium between these two systems carbon and water The analysis presented in this book restricts itself to those objects and processes that allow us to obtain reliable conclusions and numerical estimations in contrast to current climate models with much larger numbers of parameters for describing the same problems As a result in spite of the roughness of numerical parameters the book unveils a reliable and transparent physical picture of energetic phenomena in the global atmosphere In particular it shows that approximately only one fourth of atmospheric water returns from the atmosphere to the Earth in the form of free molecules It was shown that the contemporary warming of our planet has an anthropogenic character and that the average global temperature increases due to an increase of the concentration of atmospheric CO₂ molecules via an increase in atmospheric moisture as well as an increase in the amount of aerosols in the atmosphere Accumulation of atmospheric carbon dioxide plays a subsidiary role in this process and gives approximately one third in a change of the global temperature while an increase in the amount of atmospheric water by as little as only 0.3% per year explains the observed warming of the Earth The book shows how the greenhouse instability of the atmosphere evidently has its origins in the Eocene epoch presenting an analysis of the influence of various types of global energetic processes on the climate that differs from the official stance on these problems

Microphysics of Atmospheric

Phenomena Boris M. Smirnov, 2016-08-29 This book investigates elementary processes in the Earth's atmosphere involving photons electrons ions radicals and aerosols It is based on global atmospheric models such as the standard atmospheric model with averaged atmospheric parameters across the globe and over time the Earth's energetic balance and the global

electric circuit that allows to analyze fundamental atmospheric properties to be analyzed Rate constants of elementary processes in the Earth's atmosphere together with measured atmospheric parameters and existing concepts of atmospheric phenomena are used in the analysis of global and local atmospheric processes Atmospheric photoprocesses result from the interaction of solar radiation with the atmosphere and processes involving ions oxygen atoms excited atomic particles and ozone molecules Atmospheric electricity as a secondary phenomenon to atmospheric water circulation results in a chain of processes that begins with collisions of water aerosols in different aggregate states Cosmic rays are of importance for atmospheric electricity as they create positive and negative ions in the air Air breakdown in an electric field of clouds in the form of lightning may develop under the influence of cosmic ray created seed electrons which are necessary for electron multiplication in ionization wave streamers The upper atmosphere ionosphere is formed under solar radiation in a vacuum ultraviolet spectrum and absorption of this radiation leads to air photoionization The greenhouse effect is determined by atmospheric water whereas transitions between a water vapor and aerosols may lead to a change in atmospheric optical depth Carbon dioxide contributes in small portions to the atmospheric greenhouse effect Cosmic rays are of importance for atmospheric discharge the origin of lightning and cloud formation in the first stage of aerosol growth This book provides a qualitative description of atmospheric properties and phenomena based on elementary processes and simple models

Transport of Infrared Atmospheric Radiation Boris M. Smirnov, 2020-02-10 This book sets out to give a rigorous mathematical description of the greenhouse effect through the theory of infrared atmospheric emission In contrast to traditional climatological analysis this approach eschews empirical relations in favour of a strict thermodynamical derivation based on data from NASA and from the HITRAN spectroscopy database The results highlight new aspects of the role of clouds in the greenhouse effect *41st AIAA Aerospace Sciences Meeting & Exhibit*, 2003 *Bubble Systems* Alexander A. Avdeev, 2016-04-29 This monograph presents a systematic analysis of bubble system mathematics using the mechanics of two phase systems in non equilibrium as the scope of analysis The author introduces the thermodynamic foundations of bubble systems ranging from the fundamental starting points to current research challenges This book addresses a range of topics including description methods of multi phase systems boundary and initial conditions as well as coupling requirements at the phase boundary Moreover it presents a detailed study of the basic problems of bubble dynamics in a liquid mass growth dynamically and thermally controlled collapse bubble pulsations bubble rise and breakup Special emphasis is placed on bubble dynamics in turbulent flows The analysis results are used to write integral equations governing the rate of vapor generation condensation in non equilibrium flows thus creating a basis for solving a number of practical problems This book is the first to present a comprehensive theory of boiling shock with applications to problems of critical discharge and flashing under the fast decompression conditions Reynolds analogy was the key to solving a number of problems in subcooled forced flow boiling the theoretical results of which led to easy to use design formulas This book is primarily aimed at graduate and

post graduate students specializing in hydrodynamics or heat and mass transfer as well as research expert focused on two phase flow It will also serve as a comprehensive reference book for designers working in the field of power and aerospace technology

Theory of Gas Discharge Plasma Boris M. Smirnov, 2014-11-17 This book presents the theory of gas discharge plasmas in a didactical way It explains the processes in gas discharge plasmas A gas discharge plasma is an ionized gas which is supported by an external electric field Therefore its parameters are determined by processes in it The properties of a gas discharge plasma depend on its gas component types of external fields their geometry and regimes of gas discharge Fundamentals of a gas discharge plasma include elementary radiative and transport processes which are included in its kinetics influence They are represented in this book together with the analysis of simple gas discharges These general principles are applied to stationary gas discharge plasmas of helium and argon The analysis of such plasmas under certain conditions is theoretically determined by numerical plasma parameters for given regimes and conditions

Generalized Boltzmann Physical Kinetics Boris V. Alexeev, 2004-05-25 The most important result obtained by Prof B Alexeev and reflected in the book is connected with new theory of transport processes in gases plasma and liquids It was shown by Prof B Alexeev that well known Boltzmann equation which is the basement of the classical kinetic theory is wrong in the definite sense Namely in the Boltzmann equation should be introduced the additional terms which generally speaking are of the same order of value as classical ones It leads to dramatic changing in transport theory The coincidence of experimental and theoretical data became much better Particularly it leads to the strict theory of turbulence and possibility to calculate the turbulent flows from the first principles of physics Boltzmann equation BE is valid only for particles which can be considered as material points generalized Boltzmann equation GBE removes this restriction GBE contains additional terms in comparison with BE which cannot be omitted GBE leads to strict theory of turbulence GBE gives all micro scale turbulent fluctuations in tabulated closed analytical form for all flows GBE leads to generalization of electro dynamic Maxwell equations GBE gives new generalized hydrodynamic equations GBE more effective than classic Navier Stokes equations GBE can be applied for description of flows for intermediate diapason of Knudsen numbers Asymptotical solutions of GBE remove contradictions in the theory of Landau damping in plasma

Unified Non-Local Theory of Transport Processes Boris V. Alexeev, 2015-02-10 Unified Non Local Theory of Transport Processes 2nd Edition provides a new theory of transport processes in gases plasmas and liquids It is shown that the well known Boltzmann equation which is the basis of the classical kinetic theory is incorrect in the definite sense Additional terms need to be added leading to a dramatic change in transport theory The result is a strict theory of turbulence and the possibility to calculate turbulent flows from the first principles of physics Fully revised and expanded edition providing applications in quantum non local hydrodynamics quantum solitons in

solid matter and plasmas Uses generalized Boltzmann kinetic theory as an highly effective tool for solving many physical problems beyond classical physics Addresses dark matter and energy Presents non local physics in many related problems of hydrodynamics gravity black holes nonlinear optics and applied mathematics **Technical Physics** ,2006 **Physics, Uspekhi** ,2005 **Whitaker's Books in Print** ,1998
