Charles V. Ruckley,Francis G.R. Fowkes,Andrew W. Bradbury,2012-12-06 Varicose veins are a very common problem The precise aetiology of primary varicose veins remains unclear It seems likely from the available evidence that inherited structural weakness combined with haemodynamic or microcirculatory abnormalities eventually lead to reduced vein wall elasticity dilatation and the formation of varicosities Increasing age female gender parity and occupation may all promote the development of varicose veins in susceptible individuals Further clinical and experimental studies are necessary if the relative contribution of each of these factors is to be fully elucidated References 1 Editorial The treatment of varicose veins Lancet 1975 ii 311 2 Prerovsky I Diseases of the veins World Health Organisation internal communication MHO PA 10964 3 Weddell JM Varicose veins pilot study Br J Surg 1969 23 179 186 4 Hobsley M Pathways in surgical management 2nd ed London Edward Arnold 1986 5 Browse NL Burnand KG Lea Thomas M Diseases of the veins London Edward Arnold 1988 6 Logan WPD Brooke EM The survey of sickness Studies on medical and population subjects no 12 London General Register Office 1957 7 The committee on the Danish national morbidity survey The sickness survey of Denmark Copenhagen 1960 8 US Department of Health Education and welfare national health survey 1935 1936 Washington DC 1938 9 The Department of National Health and Welfare and the Dominion Bureau of Statistics Illness and health care in Canada Canadian Sickness Survey 1950 1951 Ottawa 1960 **Cumulated Index Medicus** ,1994 **Haimovici's Vascular Surgery** Larry H. **Pre-mRNA Processing** Angus I. Lamond, 2013-11-11 In the past fifteen years have seen tremendous growth in our understanding of the many post transcriptional processing steps involved in producing functional eukaryotic mRNA from primary gene transcripts pre mRNA New processing reactions such as splicing and RNA editing have been discovered and detailed biochemical and genetic studies continue to yield important new insights into the reaction mechanisms and molecular interactions involved It is now apparent that regulation of RNA processing plays a significant role in the control of gene expression and development An increased understanding of RNA processing mechanisms has also proved to be of considerable clinical importance in the pathology of inherited disease and viral infection This volume seeks to review the rapid progress being made in the study of how mRNA precursors are processed into mRNA and to convey the broad scope of the RNA field and its relevance to other areas of cell biology and medicine Since one of the major themes of RNA processing is the recognition of specific RNA sequences and structures by protein factors we begin with reviews of RNA protein interactions In chapter 1 David Lilley presents an overview of RNA structure and illustrates how the structural features of RNA molecules are exploited for specific recognition by protein while in chapter 2 Maurice Swanson discusses the structure and function of the large family of hnRNP proteins that bind to pre mRNA The next four chapters focus on pre mRNA splicing

**The Human T-Cell Receptor Repertoire and Transplantation** Peter van den Elsen, 2013-06-29 In these analyses it became clear that the MHC class I molecule comprised a distinct groove on the external side of the molecule The sides of the groove are formed by the a helical

structures of the  $\alpha$  and  $\alpha$ 12 domains and a floor which is formed by 8 anti parallel  $\beta$ 3 strands The various polymorphic residues as determined from DNA sequence analysis are localized within these  $\alpha$  helices and  $\beta$ 3 plated sheets within the groove More importantly these analyses also revealed the presence of electron dense material in the groove This material was subsequently identified as a linear peptide of 8-10 amino acids long High resolution crystallographic analyses of the class I MHC structure have revealed the existence of so called pockets within the grooves of the MHC class I molecules These pockets designated A F exhibited allele specificity and are directly involved in the binding of the peptide primarily through interaction with the dominant anchor residues as found in MHC class I associated peptides 6 7 9 11 The class II MHC antigens consist on the cell surface of a 34 kD  $\alpha$  chain non covalently associated with a 28 kD  $\beta$ 3 chain With the exception of the DR  $\alpha$  chain all other MHC class II  $\alpha$  and  $\beta$ 3 chains are polymorphic
