Quantitative Stratigraphy:

Quantitative Stratigraphy F.M. Gradstein, 1985-11-30 the volume contains original and stimulating contributions to quantitative biostratigraphy and lithostratigraphy by four authors who are foremost in this branch of science and have pioneered its application I agree with this assessment the book is clearly the place to start for those interested in becoming conversant with modern techniques of stratigraphy analysis Palaeogeography Palaeoclimatology Palaeoecology 58 1987

Stratigraphy Wang Naiwen, Jürgen Remane, 1998 This volume presents the proceedings of Symposium I Stratigraphy of the 30th International Geological Congress at Beijing The proceedings aim to present a view of contemporary geology and should be of interest to researchers in the geological sciences *Stratigraphy* Jacques Rey, Simone Galeotti, Comité français de stratigraphie, 2008 This book written by 33 stratigraphic experts presents various processes available which will enable the location in time of all rock types sedimentary metamorphic plutonic and eruptive whether they are in outcrop or at subsurface The terminology and the appropriate practices for each method are presented in separate chapters and illustrated with concrete examples The order of the chapters is modeled on the progression of the stratigraphic process from the descriptive to the interpretative from the methods of the geometric stratigraphy lithostratigraphy and genetic stratigraphy chemostratigraphy magnetostratigraphy to the chronological stratigraphy biostratigraphy followed by the chronometric stratigraphy isotopic geochronology The final two chapters are dedicated to chronostratigraphic units and correlations which combine the contributions of various methods and to the presentation of the 2007 version of the Geological Time Scale The definitions of stratigraphic terms can be found in a glossary at the end of the work The book is addressed to all professional geologists from the industrial sector as well as those in universities including teachers and researchers who would like to deepen their knowledge of the vocabulary the concepts the methods and the practical applications of different approaches of stratigraphy a reference discipline for the entirety of the geological sciences **Applied Stratigraphy** Eduardo A.M.

Koutsoukos, 2007-08-16 Stratigraphy has come to be indispensable to nearly all branches of the earth sciences assisting such endeavors as charting the course of evolution understanding ancient ecosystems and furnishing data pivotal to finding strategic mineral resources This book focuses on traditional and innovative stratigraphy techniques and how these can be used to reconstruct the geological history of sedimentary basins and in solving manifold geological problems and phenomena

Sequence Stratigraphy Dominic Emery, Keith Myers, 2009-06-29 The innovation and refinement of the techniques and concepts of sequence stratigraphy has been one of the most exciting and profound developments in geology over the past thirty years Seismic stratigraphy has now become one of the standard tools of the geoscientist and there is a pressing need for an introductory text on sequence stratigraphy This new book sets out to define and explain the concepts principles and applications of this remarkably influential approach to the study of sedimentary strata The authors take a rigorous objective stance in evaluating the techniques and interpretation of sequence stratigraphy basing the text on an internal training course

developed by British Petroleum BP A new text on this increasingly important field A practical guide based on the experience of practising sequence stratigraphers Based on a highly successful BP training course **Automated Stratigraphic Correlation** F.P. Agterberg,1990-04-26 This book provides an introduction to recent developments in automated stratigraphic correlation of fossil data using computer programs for ranking and scaling of stratigraphic events Mainframes or microcomputers can be used to aid the stratigrapher during data inventory for a region or time period for construction of a biozonation based on stratigraphic events such as the latest appearance datum of a fossil species and for automated correlation The book is intended for advanced geology students research workers and teachers with a background in stratigraphy and an interest in using computer based techniques for problem solving **Cyclostratigraphy and the Milankovitch Theory** W. Schwarzacher,1993-08-24 Cyclostratigraphy is concerned primarily with measuring geological time and the time units used in this approach are sedimentary cycles Milankovitch cycles mark time intervals of tens of thousands to several millions of years Such cycles are the result of variations in the Earth's position in relation to the Sun and these in turn determine the climatic variations The Milankovitch theory was resurrected in the 1960's when evidence from Pleistocene deep sea sediments linked orbital variations and climate This monograph discusses sedimentary cycles and their use in measuring geologic time There is considerable effort made to clarify the term sedimentary cycle in particular the two opposing concepts of cyclic stratification and event stratification The recognition of sedimentary cycles and of Milankovitch cycles specifically is considered and care is taken with the question of relating sediment thickness to time Several examples from the Carboniferous to the Cretaceous are given to show how cyclostratigraphy can be applied to current geological problems This volume should be of interest to geologists involved with stratigraphical analysis and basin analysis **Geomathematics: Theoretical Foundations, Applications and Future Developments** Frits Agterberg,2014-07-14 This book provides a wealth of geomathematical case history studies performed by the author during his career at the Ministry of Natural Resources Canada Geological Survey of Canada NRCan GSC Several of the techniques newly developed by the author and colleagues that are described in this book have become widely adopted not only for further research by geomathematical colleagues but by government organizations and industry worldwide These include Weights of Evidence modelling mineral resource estimation technology trend surface analysis automatic stratigraphic correlation and nonlinear geochemical exploration methods The author has developed maximum likelihood methodology and spline fitting techniques for the construction of the international numerical geologic timescale He has introduced the application of new theory of fractals and multi fractals in the geostatistical evaluation of regional mineral resources and ore reserves and to study the spatial distribution of metals in rocks The book also contains sections deemed important by the author but that have not been widely adopted because they require further research These include the geometry of preferred orientations of contours and edge effects on maps time series analysis of Quaternary retreating ice sheet related sedimentary

data estimation of first and last appearances of fossil taxa from frequency distributions of their observed first and last occurrences tectonic reactivation along pre existing schistosity planes in fold belts use of the grouped jackknife method for bias reduction in geometrical extrapolations and new applications of the theory of permanent volume independent frequency distributions
