

# Towards a More Accurate Theoretical Model of Quark-Gluon Plasma

Relativistic hydrodynamic models study the properties of quark-gluon plasma (QGP), a primordial state of matter that existed in the early universe

However, conventional models cannot explain particle production for very low transverse momentum ( $p_T \lesssim 1$  GeV) observed in heavy-ion collision data

Can we find a model that explains the missing particle yield in the region of low transverse momentum?

Simulating Pb-Pb ion collisions using a novel dynamical core-corona initialization framework

## Analyses

- Contribution from core and corona components
- Quantification of corona contribution
- Effect of corona component on flow observables

## Transverse momentum spectra for 0-5% centrality class

- Dominance of core components
- Stronger domination in heavy particles (protons and anti-protons)

- Significant corona components in  $p_T \lesssim 1$  GeV
- Larger in heavy particle spectra (~50% at  $p_T = 0$  GeV)

## Four-particle cumulants for charged hadrons

Corona contribution dilutes absolute value of  $c_4$  solely from core contribution

Particle yields in the very low  $p_T$  spectra can be explained by factoring in the contribution of the nonequilibrium "corona" component in heavy-ion collisions
