Animal Sonar Systems R.

Busnel, 2013-06-29 Thirteen years have gone by since the first international meeting on Animal Sonar Systems was held in Frascati Italy in 1966 Since that time almost 900 papers have been published on its theme The first symposium was vital as it was the starting point for new research lines whose goal was to design and develop technological systems with properties approaching optimal biological systems There have been highly significant developments since then in all domains related to biological sonar systems and in their applications to the engineering field The time had therefore come for a multidisciplinary integration of the information gathered not only on the evolution of systems used in animal echolocation but on systems theory behavior and neurobiology signal to noise ratio masking signal processing and measures observed in certain species against animal sonar systems Modern electronics technology and systems theory which have been developed only since 1974 now allow designing sophisticated sonar and radar systems applying principles derived from biological systems At the time of the Frascati meeting integrated circuits and technologies exploiting computer science were not well enough developed to yield advantages now possible through use of real time analysis leading to among other things a definition of target temporal characteristics as biological sonar systems are able to do All of these new technical developments necessitate close cooperation between engineers and biologists within the framework of new experiments which have been designed particularly in the past five years

Porpoises and Sonar Winthrop Niles Kellogg, 1962 *Experimentally Demonstrated Echolocation in the Amazon River Porpoise, Inia Geoffrensis* (Blainville)

R. H. Penner, A. E. Murchison, 1970 Echolocation and related behavior in the Amazon River porpoise *Inia geoffrensis* was investigated to demonstrate biological sonar within the context of operant conditioning It was found that the *Inia* s click train ranged from 25 to 200 kHz major energy was centered approximately at 100 kHz The longest periods of silence for the *Inia* were 8 sec Corollary behavior exhibited during the performance of the conditioned task indicated a two step sonic appraisal of the stimulus condition Author

Whales and Porpoises United States. Congress. House. Committee on Merchant Marine and Fisheries. Subcommittee on Fisheries and Wildlife Conservation and the Environment, 1976 *Hearing by Whales and Dolphins* Whitlow W.L. Au, Richard R. Biosonar Annemarie Surlykke, Paul E. Nachtigall, Richard R. Fay, Arthur N. Popper, 2014-07-19 Two groups of animals bats and odontocetes toothed whales have independently developed the ability to orient and detect prey by biosonar echolocation This active mechanism of orientation allows these animals to operate under low light conditions Biosonar is a conceptual overview of what is known about biosonar in bats and odontocetes Chapters are written by bat and odontocetes experts resulting in collaborations that not only examine data on both animals but also compare and contrast mechanisms This book provides a unique insight that will help improve our understanding of biosonar in both animal groups
