Hendriksen, 1996 In the past animal experimentation has played an important part in the development and quality control of immunobiological products These days however concern about animal welfare is growing and consequently increasing emphasis is placed on the use of in vitro methods This book reports the proceedings of a symposium held at the Paul Ehrlich Institute in Langen Germany in November 1994 at which the application of the three Rs principle replacement reduction and refinement of the use of animal experiments was evaluated and recommendations were given A review of the history of animal experimentation is followed by reports of various international organizations including the European Pharmacopoeia and the World Health Organization

about their activities with respect to upholding the three Rs principle It is shown that significant progress has been made in the last few years in the fields of pyrogen testing hormones blood products and vaccines Several new in vitro methods for potency efficacy and safety testing of vaccines are presented and discussed General problems such as harmonization statistics and validation serological methods and cell cultures are also addressed Demonstrating that sound science and animal welfare are not irreconcilable this volume is a valuable resource for all those concerned with the development and manufacture of biological products
