Tannock,2012-12-06 Quality is a topical issue in manufacturing Competitive quality performance still eludes many manufacturers in the traditional industrialized countries A lack of quality competitiveness is one of the root causes of the relative industrial decline and consequent trade imbalances which plague some Western economies Many explanations are advanced for poor quality performance Inadequate levels of investment in advanced technology together with insufficient education and training of the workforce are perhaps the most prominent Some believe these problems are caused by a lack of awareness and commitment from top management while others point to differences between industrial cultures The established remedy is known as Total Quality Management TQM TQM requires a corporate culture change driven from the top and involving every employee in a process of never ending quality improvement aimed at internal as well as external customers The techniques deployed to achieve TQM include measures to improve motivation training in problem solving and statistical process control SPC Quality is however only one of the competitive pressures placed It is also upon the manufacturer by the modern global economy imperative to remain economical and efficient while increasing the flexibility

and responsiveness of the design and manufacturing functions Here the reduction or elimination of stock is of great importance particularly as financial interest rates in the less successful manufacturing nations are frequently high Product life cycles must become ever more compressed in response to the phenomenal design to manufacture performance of some Pacific rim economies

Water Quality Monitoring Network Design Nilgun B. Harmancioglu,O. Fistikoglu,S.D. Ozkul,Vijay Singh,M.N. Alpaslan,1998-12-31 In recent years the adequacy of collected water quality data and the performance of existing monitoring networks have been seriously evaluated for two basic reasons First an efficient information system is required to satisfy the needs of water quality management plans and to aid in the decision making process Second this system has to be realized under the constraints of limited financial resources sampling and analysis facilities and manpower Problems observed in available data and shortcomings of current networks have led researchers to

focus more critically on the design procedures used The book is intended to present an up to date overview of the current network design procedures and develop basic guidelines to be followed in both the design and the redesign of water quality monitoring networks The book treats the network design problem in a comprehensive and systematic framework starting with objectives of monitoring and elaborating on various technical design features e g selection of sampling sites sampling frequencies variables to be monitored and sampling duration The design procedures presented are those that the authors have recently applied in a number of national and international projects on the design and redesign of water quality monitoring networks Thus the book covers real case studies where not only the methods described in the earlier titles are used but also new techniques are introduced Where earlier methods are used they are assessed with respect to their efficiency and applicability to real case problems Audience Essentially the framework adopted in the book applies as well to other hydrometric data collection networks besides those of water quality In this respect it is expected that planners designers scientists and engineers who are involved in hydrometric network design will benefit from the in depth approach assumed in this book It will also be of interest to research and data centers international programs and organizations related to environmental monitoring The book may also be used as a reference text in graduate courses of water resources and environmental engineering programs
