

Step 1: Identification of embryo type and developmental state

A *Triodia* seed, that is encased by the floret, has a fully developed, lateral embryo type

Step 2: Determine whether un-treated floret/seeds can take up water

Triodia florets and seeds have a permeable coat that does not prevent water uptake.

Step 3: Test seeds for germination over a wide temperature range

Germination of un-treated, *Triodia* florets is low (dashed line). Germination of *Triodia* seeds (i.e. floret removed) is slightly higher and occurs over a wider temperature range (e.g. coloured bars: blue = water, green = gibberellic acid, red = amaranth water).

Fig. 2 – Seedling establishment of *Triodia* seeds is enhanced after the floret is removed and adequate rainfall is received (a). Once the initial recruitment bottleneck of germination and emergence are surpassed, *Triodia* plants survive and grow un-impaired for many years (b).

Ecophysiology of High Salinity Tolerant Plants M. Ajmal Khan, Darrell J. Weber, 2006-05-16 The halophytes are highly specialized plants which have greater tolerance to salt They can germinate grow and reproduce successfully in saline areas which would cause the death of regular plants Most halophytic species are found in salt marsh systems along seashores or around landlocked inland lakes and flat plains with high evaporation The halophytes play very significant role in the saline areas specially in the coast by overcoming the salinity in different ways viz with regulating mechanisms in which excess salts are excreted and with out regulating mechanism which may include succulents or cumulative types Besides that they protect coast from erosion and cyclones provide feeding ground and nursery for fish shrimps and birds Halophytes get increasing attention today because of the steady increase of the salinity in irrigation systems in the arid and semi arid regions where the increasing population reaches the limits of freshwater availability In many countries halophytes have been successfully grown on saline wasteland to provide animal fodder and have the potential for rehabilitation and even reclamation of these sites The value of certain salt tolerant grass species has been recognized by their incorporation in pasture improvement programs in many salt affected regions throughout the world There have been recent advances in selecting species with high biomass and protein levels in combination with their ability to survive a wide range of environmental conditions including salinity
