Strength or Accuracy: Credit Assignment in Learning Classifier Systems Tim Kovacs,2012-12-06 Classifier systems are an intriguing approach to a broad range of machine learning problems based on automated generation and evaluation of condition action rules In reinforcement learning tasks they simultaneously address the two major problems of learning a policy and generalising over it and related objects such as value functions Despite over 20 years of research however classifier systems have met with mixed success for reasons which were often unclear Finally in 1995 Stewart Wilson claimed a long awaited breakthrough with his XCS system which differs from earlier classifier systems in a number of respects the most significant of which is the way in which it calculates the value of rules for use by the rule generation system Specifically XCS like most classifier systems employs a genetic algorithm for rule generation and the way in which it calculates rule fitness differs from earlier systems Wilson described XCS as an accuracy based classifier system and earlier systems as strength based The two differ in that in strength based systems the fitness of a rule is proportional to the return reward payoff it receives whereas in XCS it is a function of the accuracy with which return is predicted The difference is thus one of credit assignment that is of how a rule's contribution to the system's performance is estimated XCS is a Q learning system in fact it is a proper generalisation of tabular Q learning in which rules aggregate states and actions In XCS as in other Q learners Q values are used to weight action selection

Techniques for Designing Classification Problems Ratna Raju Mukiri,2018-10-30 The thesis is mainly concerned with classification of tasks and related issues that appear in real world scenarios such as incomplete records and irrelevant and or redundant pieces of information imbalanced class distribution and imbalanced error costs There is no universally accepted best classifier and general rules for appropriate metric to select in a certain context exist Translating the data

characteristics and problem goals into appropriate performance metrics appropriate classifier is successful data mining process An original meta learning framework for automated classifier selection is presented in the case studies section for baseline performance assessment **Creative Evolutionary Systems** Peter Bentley, Peter J.
