Abstract

The distinguishing number $D(G)$ of a graph G is the least integer d such that there is a d -labeling of the vertices of G which is not preserved by any nontrivial automorphism. For a graph G let G^r be the r th power of G with respect to the Cartesian product. It is proved that $D(G^r) = 2$ for any connected graph G with at least 3 vertices and for any $r \geq 3$. This confirms and strengthens a conjecture of Albertson. Other graph products are also considered and a refinement of the Russell and Sundaram motion lemma is proved.

1. Introduction

A labeling $\ell : V(G) \rightarrow \{1, \dots, d\}$ of a graph G is d -distinguishing if no nontrivial automorphism of G preserves the labeling. Such a labeling thus uniquely identifies vertices of G , that is, vertices are “distinguished” among themselves. The *distinguishing number*, $D(G)$, of a graph G , is the minimum d such that G has a d -distinguishing labeling.
