Plastics For Corrosion Inhibition:

Plastics for Corrosion Inhibition V.A. Goldade, L.S. Pinchuk, A.V. Makarevich, V.N. Kestelman, 2009-09-02 One of the key problems of failure free operation of machinery is prevention of corrosion. The global scale of modern production makes this problem even more critical. At the beginning of the 21st century industrial contamination and the corrosion active nature of the environment reached a level such that corrosive damage of materials became commensurate with their production volume and expenditure on anticorrosion protection of machines became comparable with investments in basic production. Anticorrosion techniques changed from being an auxiliary service to industrial enterprises into a developing scientifically intensive and generously financed branch of production. Polymers occupy a very specific place amongst anticorrosion techniques. Polymers combine good chemical resistance with impermeability to different media and unusual deformation characteristics. The main principle of their application as anticorrosion means is the creation of a tight barrier that insulates metal machine parts or constructions from corrosion agents. The advantages of polymers allow the creation of such a barrier at minimal cost, providing protection of the working machines from corrosion, combining their manufacture with preservation and decreasing the cost of anticorrosion. This is one of the main reasons why world production of polymer materials increased by almost 50% in the past decade.

Plastics for Corrosion Inhibition V.A. Goldade, 2005-04-22 The development of polymer composites containing inhibitors of metal corrosion is an important endeavour in modern materials science and technology. Corrosion inhibitors can be located in a polymer matrix in the solid, liquid or gaseous phase. This book details the thermodynamic principles for selecting these components, their compatibility and their effectiveness. The various mechanisms of metal protection, barrier inhibiting and electromechanical, are considered as are the conflicting requirements placed on the structure of the combined material. Two main classes of inhibited materials, structural and films coatings, are described in detail. Examples are given of structural plastics used in friction units subjected to mechanochemical wear and of polymer films coatings for protecting metal objects against corrosion.
