*Real Time Fault Monitoring of Industrial Processes* A.D. Pouliezos,George S. Stavrakakis,2013-03-09 This book presents a detailed and up to date exposition of fault monitoring methods in industrial processes and structures The following approaches are explained in considerable detail Model based methods simple tests analytical redundancy parameter estimation knowledge based methods artificial neural network methods and nondestructive testing etc Each approach is complemented by specific case studies from various industrial sectors aerospace chemical nuclear etc thus bridging theory and practice This volume will be a valuable tool in the hands of professional and academic engineers It can also be recommended as a supplementary postgraduate textbook For scientists whose work involves automatic process control and supervision statistical process control applied statistics quality control computer assisted predictive maintenance and plant monitoring and structural reliability and safety      **Real Time Fault Monitoring of Industrial Processes** Anastasios Pouliezos,George S. Stavrakakis,2012-12-22      **Soft Sensors for Monitoring and Control of Industrial Processes** Luigi Fortuna,Salvatore Graziani,Alessandro Rizzo,Maria Gabriella Xibilia,2007-05-31 focussed on the key steps in soft sensor design data selection model structure selection and model validation respectively Extensions to the basic steps of soft sensor design namely soft sensor performance enhancement and the modifications needed to facilitate different industrial process applications follow in Chapter 7 and 8 respectively Widening the applications range and role of soft sensors to fault detection and sensor validation configurations is dealt with in Chapter 9 A great strength of Soft Sensors for Monitoring and Control of Industrial Processes is the use throughout the text of a set of industrial case studies to demonstrate the successes and drawbacks of the different methods used to create soft sensor models A number of different methods may be used in each separate step of the soft sensor design process and the industrial case studies are often used to provide explicit comparisons of the performance of these methods The industrial control and process engineer will find these comparison exercises invaluable illustrations of the sort of results that might be found in industrial applications The monograph also highlights the importance of using knowledge from industrial experts and from the existing industrial process literature This is an important aspect of industrial control that is not very widely acknowledged or taught in control courses Most industrial processes have already generated a significant experimental knowledge base and the control engineer should develop ways of tapping into this valuable resource when designing industrial control schemes      *Real Time Microcomputer Control of Industrial Processes* S.G. Tzafestas,J.K. Pal,1990-08-31 The introduction of the microprocessor in computer and system engineering has motivated the development of many new concepts and has simplified the design of many modern industrial systems During the first decade of their life microprocessors have shown a tremendous evolution in all possible directions technology power functionality I O handling etc Of course putting the microprocessors and their environmental devices into properly operating systems is a complex and difficult task requiring high skills for melding and integrating hardware and

Tzafestas,2013-12-01 Intelligent Systems involve a large class of systems which posses human like capabilities such as learning observation perception interpretation reasoning under uncertainty planning in known and unknown environments decision making and control action The field of intelligent systems is actually a new interdisciplinary field which is the outcome of the interaction cooperation and synergetic merging of classical fields such as system theory control theory artificial intelligence information theory operational research soft computing communications linguistic theory and others Integrated intelligent decision and control systems involve three primary hierarchical levels namely organization coordination and execution levels As we proceed from the be performed organization to the execution level the precision about the jobs to increases and accordingly the intelligence required for these jobs decreases This is in compliance with the

principle of increasing precision with decreasing intelligence IPOI known from the management field and theoretically established by Saridis using information theory concepts This book is concerned with intelligent systems and techniques and gives emphasis on the computational and processing issues Control issues are not included here The contributions of the book are presented in four parts as follows **Remote Manipulation Systems** L.I. Slutski,2012-12-06 A famous French writer Anatole France liked to say The future is a convenient place to position our dreams 1927 Indeed this remark gains full meaning when one considers the history of what we call today Robotics For more than 3000 years mankind has dreamt ofthe possibility of arti ficial machines that would have all the advantages of human slaves without any of their drawbacks With the developments in technology since the end of World War II mainly with the explosive progress of computers it was thought we might at last succeed in transforming this everlasting dream into reality In the mind of scientists of the 1950 s to make such intelligent and autonomous machines before the year 2000 seemed a small challenge it was obvious thanks to computers and Artificial Intelligence But in spite of progress in some directions we must admit that the dream remains a dream and that the basic problems denying us a successful issue are not solved In fact if we except industrial robots only calling for classical automata theory the main advanced result concerning autonomous and intelligent machines is related to some understanding of reasons why we have failed during the past years **Advances in Intelligent Autonomous Systems** S.G. Tzafestas,2012-12-06 The field of Intelligent Autonomous Systems lAS has attracted over the years the attention of numerous research and industrial groups and has by now arrived at an advanced level of development The results have been achieved through the synergetic use of concepts techniques and technologies drawn from electrical and mechanical engineering control engineering systems science computer science and management science Currently the majority of working systems in practice are of the semi autonomous type needing some level of human intervention Therefore much effort is presently devoted in academic research and industrial environments towards further increasing the level of autonomy This book provides a collection of essays which cover the latest research in the lAS field and present a rich set of results accompanied by detailed descriptions of the relevant concepts tools techniques and hardware software designs The book contains twenty three chapters grouped in the following parts Part 1 General concepts architectures and technologies Part 2 Mobile walking and snake like robots Part 3 Applications PART 1 involves the first seven chapters which deal with generic issues Chapter 1 by S G Tzafestas provides some background material accompanied by a description of two research lAS prototypes namely a car disassembly robotic system and a semi autonomous autonomous robotic wheelchair Chapter 2 by G Bolmsjo M Olsson and K Brink presents a generic event based control system structure for the control of a robotic workcell including its implementation where the autonomous operation is achieved via reactive replanning and configurable corrections
