Recent Antarctic And Subantarctic Brachiopods Volume 21 Of The Antarctic Research Series:

Recent Antarctic and Subantarctic Brachiopods Merrill W. Foster, 1974 Published by the American Geophysical Union as part of the Antarctic Research Series Volume 21 The Recent brachiopod faunas from southernmost South America Antarctica and the Subantarctic consisting of 21 genera and 37 species are described from new material New taxa include the genera *Manithyris* and *Bathynanus* Also new are 11 species *Compsothyris ballenyi* *Hispanirhynchia chiliensis* *Manithyris rossi* *Liothyrella multiporosa* *Liothyrella scotti* *Bathynanus tenuicostatus* *Eucalathis macrorhynchus* *Amphithyris hallettensis* *Dallina eltanini* *Fallax antarcticus* and *Magellania spinosa* Factor analysis was used to study relationships among morphological characters and environmental parameters In *Liothyrella* negative associations were found between beak height and water depth The size of the pedicle opening within this genus is associated with the width of the hinge plate and the loop apparently these associations are related to increased dorsal adductor muscle size with increased pedicle size Similar relationships are found in the terebratulids although here all of the characters are also negatively associated with water depth Characters negatively associated with water depth may relate to the differing current strength at various depths Puncta density is positively correlated with water temperature Examples of brachiopod variation are discussed Synonyms have resulted from former failure to study large samples and to appreciate the extent of brachiopod variation A priori valuation of certain characters as being specific is unwarranted since sibling species may be more similar than different subspecies of the same species Many Recent and fossil brachiopod genera are too narrow in definition owing to oversplitting or to a narrow conception of monophyly I advocate somewhat broader and more practical genera for obtaining the maximal information value from such taxa Brachiopods contrary to popular belief are an abundant and viable group in the southern hemisphere faunas Most brachiopods in the Ross Sea appear to have definite niches and habitats but may overlap geographically where population densities are low Brachiopods here can be divided roughly into a slope and a shelf assemblage The greatest species diversity occurs at the seaward edge of the Ross Sea shelf interpreted as an ecotone effect where two different water types meet Only South America and Antarctica appear to have or have had direct communication between some elements of their brachiopod faunas Other similarities between separate southern continents are related to retention of common pre Cenozoic elements or to chance dispersal of larvae across barriers Events related to cooling during the late Pliocene or Pleistocene caused reduction of puncta density shell thickness and spiculation in the Recent fauna and apparently influenced the present species structure at least in *Liothyrella uva* *Gyrothyris mawsoni* and *Macandrevia*
