Characterization of novel viruses in deciduous tree species in forests and public green spaces - case studies in *Quercus robur* and *Fraxinus excelsior* (Band 60) Marius Rehanek, The health of plants in general and deciduous trees in particular is influenced by a variety of factors including abiotic and biotic factors Uncountable harmful organisms can lead to a weakening of deciduous trees and shrubs in forests and urban green which are worth protecting due to their longevity and the invaluable ecosystem services they provide as well as their high economic value In this context plant viruses play a major role and must be considered Due to their ability to affect the host metabolism for the purpose of their own replication they can influence the vitality of trees change their susceptibility to other stress factors and thus lead to economic and ecological losses In recent years established technologies in the field of sequencing and bioinformatics have revealed the high abundance and enormous diversity of viruses in forest trees New viruses of the genus Emaravirus have been discovered in numerous hosts including herbaceous and woody plants Especially in deciduous trees emaraviruses have become the most widespread virus group causing diseases in important species of temperate and boreal forests In this doctoral thesis genetic and biological aspects of novel viruses were studied with special focus on the emerging group of emaraviruses Using the case studies common oak *Quercus robur* L and common ash *Fraxinus excelsior* L epidemiological studies revealed a wide distribution of common oak ringspot associated virus CORaV and ash shoestring associated virus ASaV in forest and urban trees CORaV and ASaV can be differentiated from other pathogens based on specific leaf symptoms With the help of a newly developed diagnostic ELISA CORaV can be reliably detected serologically in diseased oak trees A new species of rust mite is likely to be the vector for virus transmission Based on the results considering the composition of emaraviral accessory proteins the taxonomic order of the genus Emaravirus can be revised In addition to ASaV cytorhabdoviruses were shown to frequently infect common ash in natural and managed forest sites Genetic characterization provided evidence for two distinct cytorhabdovirus species affecting not only *Fraxinus excelsior* but also manna ash *Fraxinus ornus* and red ash *Fraxinus pennsylvanica* Applying High throughput sequencing HTS analyses sequence information about novel viruses belonging to different families have been revealed The doctoral thesis provides new insights into the diverse virome of deciduous trees thereby highlighting the demand for further studies on this fascinating group of pathogens Their characterization and interaction with other abiotic and biotic stressors may serve as a basis for better disease management concepts of essential long living trees in the future
