Vanangamudi,G. Sastry,S. Kalaivani,A. Selvakumari,M. Vanangamudi,P. Srimathi,2010-03-01 Seed is the source of future plants or foods is the storage place of culture of history is the first link in the food chain is the ultimate symbol of food security Seed is the source of life Seeds are basic in crop production No agricultural practice can improve a crop beyond the limits set by the seed Quality seed is the key for successful agriculture which demands each and every seed should be readily germinable and produce a vigorous seedling ensuring high yield Care with the seed and joy with the harvest and Good seed doesn t cost it always pays are the popular adage which enlightens the importance of the quality seed The farmers always very much interested in the best seed management practices which are safe environmentally sound and scientifically proven technologies Understandably in view of the importance of quality seeds in Agriculture both as a product and as a means of establishing a crop most attention at all levels of investigation has been directed to crop seeds Since seed is a biological entity deterioration beyond harvest is inevitable The consequences of low quality seeds are poor germination low and delayed emergence and weak growth leading to poor field stand and ultimately reflecting on reduced yield Low productivity could be attributed broadly to use of poor quality seeds At present to overcome this several seed enhancement techniques are available for quality upgradation It has two goals one is related to seed designing and other to seed functioning The rationale for pre sowing seed enhancement techniques is to mobilize the seeds own resources and to augment them with external resources to get maximum improvement in field stand establishment and yield To achieve this several physical physiological and biochemical treatments are available at present to give value addition to seeds Physiological seed treatments that improve seed performance are based primarily on seed hydration and dehydration Among several non physiological seed treatments coating or pelleting can also indirectly improve seed germination stand establishment and crop productivity **Data Quality** Jack E. **Guidelines for Sensory Analysis in Food Product**

**Development and Quality Control** David H. Lyon, Mariko A. Francombe, Terry A. Hasdell, 2012-12-06 Sensory analysis is not new to the food industry but its application as a basic tool in food product development and quality control has not been given the recognition and acceptance it deserves This we believe is largely due to the lack of understanding about what sensory analysis can offer in product research development and marketing and a fear that the discipline is too scientific to be practical To some extent sensory scientists have perpetuated this fear with a failure to recognize the constraints of industry in implementing sensory testing procedures These guidelines are an attempt to redress the balance Of course product tasting

is carried out in every food company it may be the morning tasting session by the managing director competitor comparisons by the marketers tasting by a product expert giving a quality opinion comparison of new recipes from the product development kitchen or on line checking during production Most relevant though is that the people responsible for the tasting session should know why the work is being done and fully realize that if it is not done well then the results and conclusions drawn and their implications are likely to be misleading If through the production of these guidelines we have influenced some people sufficiently for them to re evaluate what they are doing and why we believe our efforts have been worthwhile

**Product/Process Fingerprint in Micro Manufacturing** Guido Tosello,2019-05-31 The continuous miniaturization of products and the growing complexity of their embedded multifunctionalities necessitates

continuous research and development efforts regarding micro components and related micro manufacturing technologies. Highly miniaturized systems manufactured using a wide variety of materials have found application in key technological fields such as healthcare devices, micro implants, mobility, communications, optics, and micro electromechanical systems. Innovations required for the high precision manufacturing of micro components can specifically be achieved through optimizations using post process i.e. offline and in process i.e. online metrology of both process input and output parameters as well as geometrical features of the produced micro parts. However, it is of critical importance to reduce the metrology and optimization efforts since process and product quality control can represent a significant portion of the total production time in micro manufacturing. To solve this fundamental challenge, research efforts have been undertaken in order to define, investigate, implement, and validate the so-called product process manufacturing fingerprint concept. The product manufacturing fingerprint concept refers to those unique dimensional outcomes e.g. surface topography, form error, critical dimensions, etc. on the produced component that if kept under control and within specifications ensure that the entire micro component complies to its specifications. The process manufacturing fingerprint is a specific process parameter or feature to be monitored and controlled in order to maintain the manufacture of products within the specified tolerances. By integrating both product and process manufacturing fingerprint concepts, the metrology and optimization efforts are highly reduced. Therefore, the quality of the micro products increases with an obvious improvement in production yield. Accordingly, this Special Issue seeks to showcase research papers, short communications, and review articles that focus on novel methodological developments and applications in micro and sub micro scale manufacturing process monitoring and control as well as micro and sub micro product quality assurance. Focus will be on micro manufacturing process chains and their micro product process fingerprint towards full process optimization and zero defect micro manufacturing.
