## Human reproduction

Human reproduction is sexual reproduction involving male and female reproductive cells called gametes. The reproductive system includes organs called gonads that produce gametes and hormones; ducts for transport, storage and composition of gametes; accessory organs and glands for fluid secretion; and internal genitalia. Reproduction is regulated by hormones produced by the gonads, the hypothalamus and the pituitary gland. Fertilisation involves the introduction of sperm into the vagina. The sperm travels through the female reproductive tract until it encounters an ovocyte, a female sex cell. Fertilisation can then take place.

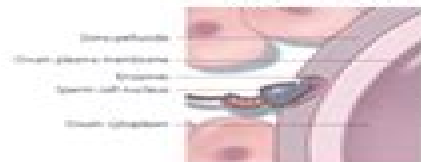

## Male reproductive system

The adult male reproductive system is a complex of two primary external structures, the testes and the penis. The testes are divided into thousands of tiny compartments or tubules containing seminiferous tubules, tightly coiled structures where sperm formation takes place.

The testes are situated in a sac called the scrotum, which provides support and regulates the position of the testes relative to the body. The scrotum moves back and forth to change its external temperature to maintain the proper temperature within the testes for sperm formation.

Seminiferous tubules produce sperm cells, which are released into the epididymis, a structure in the scrotum responsible for maturing the sperm and directing it to the vas deferens and penile urethra, where the development of male secondary sex characteristics occurs.

### Acrosomal reaction

### Fusion of plasma membranes

## Fertilization

The upper portion of the vagina leads to the vaginal canal for fertilisation. Millions of sperm travel through the female reproductive tract, ultimately only a few reach the egg. Within a sperm, the nucleus contains the genetic material. The sperm travels through a path made by the digestive cells of the vagina. When the cell membrane of the egg and sperm come in contact, the membranes fuse, and the sperm nucleus and associated material enter the egg. Other sperm are prevented from entering by a chemical change in the zona pellucida.

The egg nuclear membrane dissolves the chromosomes of the egg and sperm combine, and a fertilised egg, or zygote, is formed. The change process starts with a nuclear division, producing 2 identical cells called blastomeres.

### Zona reaction

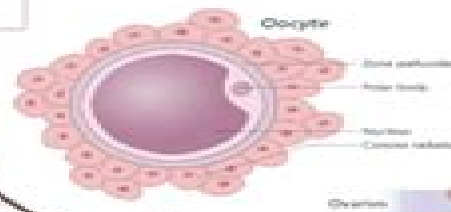

### 2-cell stage

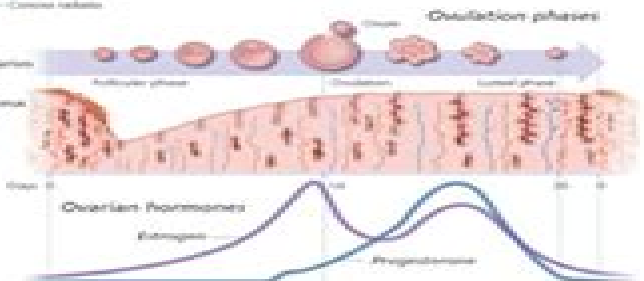

## Female reproductive system

The internal structure of the adult female reproductive system includes the vagina, uterus, ovaries and oviducts. These structures form a pathway allowing the release of an egg cell, fertilisation, its growth and delivery of a developed fetus. The vagina is a muscular canal that receives the sperm and provides a passage for menstrual discharge. The uterus is a hollow pear-shaped organ with muscular walls that contract during childbirth. The lower lining of the uterus is the endometrium, which sheds during each menstrual cycle in preparation for implantation by a fertilised egg. This lining is shed during menstruation if fertilisation does not occur.

### Spermatozoon

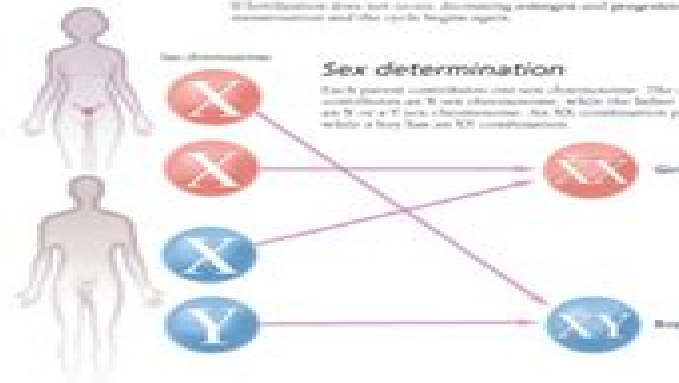

The ovaries, located on each side of the uterus, are responsible for producing ova as well as the female sex hormones estrogen and progesterone. Estrogens are responsible for the development of the female reproductive structures, sexual characteristics, and breast development. Progesterone prepares the uterus lining for implantation of a fertilised egg and is necessary for breast milk production. The ovaries are connected to the uterus by the ovarian tubes, narrow ducts that provide a passageway for the egg to reach the uterus.

## Ovulation & the menstrual cycle

The menstrual cycle refers to the sequence of events that occurs in the endometrium, the cell lining lining the uterus. The cycle normally lasts approximately 28 days. The purpose is to prepare the uterus for possible pregnancy. The menstrual cycle is governed by the endocrine system. If fertilisation does not occur, declining estrogen and progesterone levels initiate menstruation and the cycle begins again.

Two volume set a complete guide to medical physiology for undergraduate medical students Covers both clinical and applied physiology of all anatomical systems Includes numerous photographs and invaluable learning tools Textbook of Medical Physiology\_3rd Edition-E-book Indu Khurana, Arushi Khurana, Narayan Gurukripa Kowlgi, 2019-11-11 The third edition of this book incorporates thoroughly revised and updated text organized into twelve sections and arranged in three parts Part I General Physiology includes one section having five chapters Part II Systemic Physiology has been arranged into ten sections one on each body system Part III Specialized integrated physiology includes one section comprising of seven chapters Complete and up to date text incorporating recent advances Illustrated by more than 1100 clear line diagrams Complemented with numerous tables and flowcharts for quick comprehension Applied aspects highlighted in the boxes have been expanded and updated with recent molecular concepts on pathophysiology advances in investigations and therapeutic principles Additional important information has been highlighted as important notes The above features of this book make it an indispensable text for postgraduates in Physiology Candidate preparing for PG entrance examination would also find it as an authentic reference source Complimentary access to full e book **Population Sciences**, 1977 *Reproduction in Mammals* Virginia Hayssen, Teri J. Orr, 2017-10-27 Newborn mammals can weigh as little as a dime or as much as a motorcycle Some receive milk for only a few days whereas others nurse for years Humans typically have only one baby at a time following nine months of pregnancy but other mammals have 20 or more young after only a few weeks in utero What causes this incredible reproductive diversity Reproduction in Mammals is a fascinating examination of the diverse reproductive strategies of a broad spectrum of mammals and the ways in which natural selection has influenced that diversity While accounts of reproduction in individual taxa abound this unique book's comprehensive coverage gathers stories from many taxa into a single cohesive perspective that centers on the reproductive lives of females The authors shed light on intriguing questions such as Do bigger moms have bigger babies Do primates have longer pregnancies than other groups Do aquatic animals have particular patterns Do carnivores like lions often produce larger litters than prey species The book opens with the authors definition of what constitutes a female perspective and an examination of the evolution of reproduction in mammals It then outlines the individual female her genetics anatomy and physiology From this nuanced basis the text progresses to mirror the female reproductive cycle and includes her interactions with males and offspring The final section contextualizes the reproductive cycle within the rest of the world both abiotic and biotic environments To close the authors include dedicated chapters on human concerns conservation and women as mammals Readers will come away from this thought provoking book with an understanding not only of how reproduction fits into the lives of female mammals but also of how biology has affected the enormously diverse reproductive patterns of the phenotypes we observe today Provided
